PA residents add 6% sales tax. Free shipping for PA residents. Orders by company and personal checks held 3 weeks. Defective products require prior return authorization. Defective products will be replaced or repaired according to warranty. No used or reconditioned products sold. Prices and availability are subject to change without notice. No cash refunds.

# THESE TWO WARGAMES CAN KEEP YOU HAPPY.

On diskette for  
48K ATARI® 8-bit  
Home Computers and  
COMMODORE 64/128™.  
\$29.95

Forever is a *long* time. And that's about how long these two extraordinary wargames can keep you entertained. How? By letting you create an infinite number of scenarios, they literally provide you with an endless supply of different games.

**WARGAME CONSTRUCTION SET™** allows you to design your own wargames, draw your own battlemaps, and create soldiers and scenarios that are limited only by your imagination. You can choose four levels of scale, from tactical man-to-man combat to large-scale strategic campaigns. Endow your fighting men and machines with such attributes as unit type, weapon type and firepower, movement and strength points.

This refreshingly different game gives you the unique opportunity to create battles from *any* period in military history, from Ancient

Wars with spears and catapults to modern conflicts using advanced missiles and tanks. You can also engage in sword-and-sorcery fantasy adventures or fight science-fiction battles.

If you don't want to make up your own scenarios, we've provided eight ready-to-play games (five solitaire, three 2-player). And even these can be modified if you want!

**WARSHIP™** is the ultimate tactical game of naval surface combat in the Pacific, from 1941 to 1945. You can re-enact actual battles using real ships fighting under historical conditions, or create an unlimited number of hypothetical surface battles by modifying ship data and drawing your own maps.

Choose from 79 classes of war-

ships from the Allied and Japanese fleet of battleships, cruisers, destroyers and transports. Each ship comes historically rated for a host of specifications, all of which can be altered to suit your liking.

Whether you play the scenarios we've provided or create your own, you are guaranteed the "feel" of real battle. You set the course and speed, fire torpedoes and select targets for individual ships or for a whole division.

During combat, the computer keeps track of *every* single shell hit! It calculates damage based on such variables as armor strength, location of hit, and penetration ability of each shell. Collisions, flooding, fire, and damage to the bridge, rudder, engines, radar and electrical systems are all part of

On diskette for  
48K APPLE® II  
Series, ATARI  
(8-bit) and  
C-64/128. \$59.95

this incredibly detailed simulation.

We can go on and on about the flexibility, features and challenges these exciting games have to offer. But when we said "forever" in the headline, we meant playing, not reading! To find the closest thing to eternal happiness in wargaming, check out these two games at your local computer/software or game store today!

If there are no convenient stores near you, VISA and MasterCard holders can order by calling toll-free 800-443-010, x335. To order by mail, send your check to: Strategic Simulations, Inc., 1046 N. Rengstorff Ave., Mountain View, CA 94043. Be sure to specify the computer format of the game. California residents, please add applicable sales tax.

Add \$2.00 to your order for shipping and handling. Allow 4-6 weeks for delivery. In the Continental U.S., U.P.S. Blue service (faster shipping time) is available for \$4.00.

## Editorial

Many of you sent us letters or electronic mail wondering why we haven't said much lately about ANTIC ONLINE—or added much to our CompuServe edition either.

Well, we missed you at least as much as you missed us. We enjoy providing the fastest and most in-depth Atari news to thousands of users each month on ANTIC ONLINE. But although we felt bad about the temporary slowdown, all of us here are happy that contract negotiations have been concluded to everyone's satisfaction.

More important, we're sure that *you* will also be happy with the vastly expanded but streamlined new ANTIC ONLINE, which now becomes the first online magazine to offer these important new features we *couldn't* bring you before:

- **SOFTWARE ONLINE**—Every month there will be new 8-bit and ST programs you can download, without any extra charge. These will showcase the best programs from Antic's five years of publication. And as we replace programs each month, the previous titles will be transferred to the SIG\*Atari data libraries and remain accessible online.

- **PICTURE GALLERY**—New RLE (Run Length Encoding) high resolution graphics will be available each month for downloading or online viewing. ANTIC ONLINE will even be able to display pictures accompanying news stories. You'll *read* about a product or convention and then *see* it onscreen. You can submit your own best ST or 8-bit RLE pictures too.

- **SUBSCRIPTIONS ONLINE**—Now you can place your subscription orders online for Antic Publishing magazines and later be billed directly.

## ALL-NEW MENUS

During our hiatus, Antic literally spent months of man-hours to create

a dramatically streamlined menu structure for ANTIC ONLINE. Now you can see what's new as soon as you enter ANTIC ONLINE. No more wading through pages of submenus and old files before finding out about the newest products and developments. Only the best of the old material will remain in our archives. So it won't get in your way, but it's still there if you need it.

ANTIC ONLINE is CompuServe's largest online magazine—1.5 megabytes of Atari information, and growing. We are now able to update it daily (except between Friday and Sunday) directly from Antic. CompuServe still does the final merge in Columbus, Ohio. But all other preparations are now done right here at Antic, under the responsibility of newly-named ANTIC ONLINE editor Charles Jackson. This gives Antic much more control than we used to have over how soon we can upload material and where it's placed.

Next month Antic Magazine will provide many more details about how to get around on the new ANTIC ONLINE. However, we want to assure Atari users groups that it's still okay to download *any text article* from ANTIC ONLINE and reprint it in your newsletter—if you display the Antic copyright and permission notice at the top of each article you reprint.

To visit the new ANTIC ONLINE, just type GO ANTIC next time you log onto CompuServe. If you don't already subscribe to CompuServe, see your computer retailer or phone (800) 848-8199 to find out how to sign up. Ohio residents phone (614) 457-0802. There is never an extra charge for accessing ANTIC ONLINE.

*Nat Friedland*

Nat Friedland  
Editor, Antic

# BREAK THROUGH!

## STEREOTEK GLASSES— true stereoscopic 3D graphics for your Atari ST.

Put on the STEREOTEK glasses and jump into a new universe. Discover a magical world that you always knew existed. That extra dimension—DEPTH. Now you can add depth to your computer graphics with the STEREOTEK Liquid Crystal glasses. Solid, realistic, 3D images you want to reach out and touch. STEREOTEK glasses plug into your ATARI ST cartridge port to provide absolutely realistic 3D graphics in full color or hi-res monochrome.

Your STEREOTEK depth-view system includes:

- One pair electronic Liquid Crystal Shutter glasses with four-foot cable (can be comfortably worn over eyeglasses).
- ST cartridge interface unit—supports two sets of glasses (second set optional).
- DEGAS Elite Stereo Desk Accessory.
- Stereo CAD-3D animation and stereo slide show by Tom Hudson.
- For programmers: Complete developer's instructions plus source code for adding stereo to your own programs.

**STEREO  
TEK**  
Three  
Dimensional  
Glasses

The secret to full-color stereo images on a computer screen is electronic Liquid Crystal Shutter (LCS) glasses. Two optical shutters in eyeglass frames are connected electronically to the ST. Every time the ST screen refreshes (60hz/color, 70hz/mono), one shutter closes and the other opens. The monitor displays alternating right and left eye

views synchronized with the shutters. The alternating views appear faster than the eye can see, and your brain translates the normally flat monitor image into one of startlingly realistic depth. Because of the ST's speed, RAM size and cartridge port, this advanced graphics technology is only available on the Atari ST. (One megabyte RAM recommended).

Developed by LC Technologies. Distributed by The Catalog.  
LC Technologies is a venture of Tektronix of Beaverton, OR.  
Dealer inquiries welcome, call (415) 957-0886

# BESTSELLERS

...from the premiere  
ST book publisher

What reviewers say about Abacus Books:

**On ST Internals:**

...will not be going any farther than arms reach from my computer...ST Applications ...the best and most useful volume out so far...can't afford not to have it.—STart, Dewitt Robbeloth

**On GEM programmer's Reference:**

Anyone interested in learning how to manipulate the VDI or the AES will want to have this book at their fingertips...—ST Applications, Richard Kaller  
The next most important Abacus book... —STart, Dewitt Robbeloth

## Presenting the Atari ST

Gives you an in-depth look at this sensational new computer. Learn about the architecture of the ST, working with GEM, the mouse, operating system, all the various interfaces, the 68000 chip and its instructions, LOGO. 180pp \$16.95

## ST INTERNALS

Essential guide to the Inside information of the ST. Detailed descriptions of sound and graphics chips, internal hardware, I/O ports, using GEM. Commented BIOS listing. An indispensable reference for your ST library. 450pp \$19.95

## ST Machine Language

Program in the fastest language for your ATARI ST. Learn 68000 assembly language, its numbering system, use of registers, structure & important details of instruction set, and use of internal system routines. Geared for the ST. 280pp \$19.95

## ST GRAPHICS & SOUND

Detailed guide to graphics and sound on the ST. 2D & 3D function plotters, Moiré patterns, graphic memory and various resolutions, fractals, recursion, waveform generation. Examples written in C, LOGO, BASIC and Modula2. 250pp \$19.95

## Atari ST for Beginners

Written for the firsthand ST user. Get a basic understanding of your ST. Explore LOGO and BASIC from the ground up. Simple explanations of the hardware and internal workings of the ST. Illustrations, diagrams. Glossary. Index. 200pp \$16.95

## GEM Programmer's Ref.

For serious programmers needing detailed information on GEM. Presented in an easy-to-understand format. All examples in C or assembly language. Covers VDI and AES functions. No serious programmer should be without. 410pp \$19.95

## ST TRICKS & TIPS

Fantastic collection of programs and info for the ST. Complete programs include: super-fast RAM disk; time-saving printer spooler; color print hardcopy; plotter output hardcopy; creating accessories. Money saving tricks and tips. 260pp \$19.95

## ST LOGO User's Guide

Take control by learning ST LOGO—the easy to use, powerful language. Includes: file handling, recursion, Hilbert & Sierpinski curves, 2 & 3D function plots, data structure, error handling. Helpful guide for LOGO users. 375 pp \$19.95

## ST Disk Drives - Inside and Out

As the foremost publisher of ST books, we announce the newest volume in our continuing ST Reference Library series—**ST Disk Drives - Inside and Out**. This book includes chapters on files, file structures and data management. Thoroughly discusses the floppy disk, the hard disk and the RAM disk both from a programming and a technical perspective. Includes several full-length utilities and programming tools that enable you to further explore to ST disk drives. Available March. 450pp \$24.95

## ST PEEKS & POKES

Enhance your programs with the examples found within this book. Explores using different languages BASIC, C, LOGO and machine language, using various interfaces, memory usage, explore the VDI using BASIC, more. 280pp \$16.95

## Intro to MIDI Programming

Discover the magic of MIDI! Learn MIDI programming, how to program your synthesizer, how to buy MIDI software, how to buy a synthesizer, use extended BIOS. Includes source code for ST music box auto-player from Xlent Software. 250pp \$19.95

## ST BASIC Training Guide

Thorough guide for learning ST BASIC. Detailed programming fundamentals, commands descriptions, ST graphics & sound, using GEM in BASIC, file management, disk operation. Tutorial problems give hands on experience. 316pp \$16.95

## ST BASIC to C

Move up from BASIC to C. If you're already a BASIC programmer, you can learn C all that much faster. Parallel examples demonstrate the programming techniques and constructs in both languages. Variables, pointers, arrays. 230pp \$19.95

## ST 3D GRAPHICS

FANTASTIC! Learn how to create fantastic and impressive 3D graphics on your Atari ST. Rotate, zoom and shade 3D objects. All programs written in machine language for high speed. Learn the mathematics behind 3D graphics. Hidden line removal, shading. With 3D pattern maker and animator. 350pp \$24.95

## Optional program diskettes

Available for our ST book titles. The diskettes contain most of the programs found in the text of the book and saves you the time and trouble of typing them in. Each diskette: \$14.95

Call or write for your **FREE CATALOG** or the name of the dealer nearest you. Or you can order directly using your MC, VISA or Amex charge card. Add \$4.00 per order for shipping and handling. Foreign orders add \$10.00 per item. Dealers inquires welcome—over 2000 dealers nationwide.

Phone (616) 241-5510

Telex 709-101 • Fax (616) 241-5021

you can count on  
**Abacus**

P.O. Box 7219 Dept. A3 Grand Rapids, MI 49510

## MDA ATARITHON

This summer I worked on my hometown Muscular Dystrophy Association Telethon. The dealer that had previously supplied computers went out of business, so donors' names, addresses and donations had to be listed by hand. But a friend and I brought our Ataris (800XL and 600XL) and I wrote a quick program to track all this information. We had a good time and I got to show off my computer to the whole community.

Oscar Fowler  
CompuServe ID  
72347,1655

## SHARED HARD DRIVE

Is it possible for an 8-bit Atari and an ST to share the same hard disk drive?

Lenny Tamburello  
East Hanover, NJ

*Theoretically it's possible to connect one hard disk to both computers if you have interfaces for each. But using data on the same hard disk in both 8-bit and ST file formats would be quite a programming challenge. In an upcoming issue, we will review the Lurie & Associates Hard Disk System (up to 128Mb) for Atari 8-bits. The company plans to offer an ST interface soon. Lurie & Associates, P.O. Box 7546, Van Nuys, CA 91409. (818) 780-1783.—ANTIC ED*

## HELP FOR DISABLED

On behalf of the severely physically handicapped who now (or wish to) enjoy the Atari, I appeal to programmers to try to include all starting controls, options and other controls in simple menus accessed by the joystick. It's very frustrating to require someone else to press keys when you're not in a position to do so. We have taken a great step forward in the past few years in recognizing that the handicapped can enjoy the things we take for granted if we just include them in our thinking and designing of things.

W.E. Barton  
Chatsworth, CA

## BUDGET DB UPGRADE

I have an enhancement to the excellent program, *Budget dB* (Antic, November 1986). When listing transactions to the screen, the prompt "C to cont" gets printed at the top of the screen after the second page is listed, overwriting part of a transaction. Typing "C" at that point ends the listing. To correct this, delete POSITION N0,22 in line 445.

Jim Barnett  
Gaithersburg, MD

## NEEDS DEVELOPERS KIT

I am unable to locate a Resource Construction Set anywhere. Can private individuals get the Atari Developers Package? If so, how? It appears the RCS and the Atari/DRI documentation are worth the price. If not, what now?

Joel Hart

*Yes, anyone may purchase the Atari Developers Kit directly from Atari by sending \$300 to Atari, Inc., 1196 Borregas Ave., Sunnyvale, CA. 94088. Write on the outside of the package you want the Developers Kit. In addition to 1500 pages of ST/GEM documentation, you'll receive six disks packed with Alcyon C, a linker, a debugger, a text processor, many tools, and example source code. Oh, you get Atari's RCS, too.*

*You'll also be admitted to CompuServe's Atari Developers SIG, where many people who make the ST tick (like SYSOP\*Tom Hudson 76703,4224) visit every day to answer questions. There are other RCS's available, however. The RCS which comes with MegaMax C (\$200) is a good one, and KUMA has just released an RCS of their own. RCS 2.1 was available for downloading from CompuServe for a while, but has disappeared as of this writing.—ANTIC ED*

## MICROLINE 1025

The Atari 1025 does have adjustable tractor feed capability. It's basically the same printer as Okidata's Microline 80. Cascade Electronics sells a tractor drive for this printer for \$35 and it fits the 1025 perfectly. Cascade Electronics Inc., Route 1, Box 8, Randolph, MN 55065. (507) 645-7997.

Gary Martin  
Dothan, AL

## ULTIMA RUNES

Most of the characters in the archaic alphabet of Lord British's *Ultima IV* (Origins Software) can be found under "rune" in the *American College Dictionary* (Random House). Translating the ancient language on the cloth map of *Ultima IV* into English is a great help when moving players between cities.

As a further clue, remember that mandrake root and nightshade can be found only when both moons are dark.

Marjorie Martin  
San Francisco, CA

## CHROMA BOOST

The "busy" appearance of the video display background described in Jon Krahmer's *XL Color Boost* (Antic, November 1986) is actually a video problem originating in the composite video signal output. The problem varies according to whether the unit was manufactured in Hong Kong or Taiwan, and it's less noticeable on high-quality monitors because their wide range of contrast control permits greater suppression of the background than can be achieved on a television set.

Benjamin Poehland  
Frazer, PA

## 1020 PENS: FOUND

*A number of readers replied to Russ Novotny's cry for Atari 1020 Plotter pens (December, 1986). Radio Shack carries a set of three black pens (26-1480) and another trio with red, green and blue (26-1481). Each of these 1020-compatible sets costs about \$2.95. If you're out of paper for your 1020, Radio Shack's roll paper for the CGP-115 plotter (26-1428) will do fine—but you'll have to transfer some paper to an empty spool, because the full CGP roll is too big to fit into the 1020.*

*Thanks to Pete Harker, Cory Laidlaw, David Brown, Raymond Aston, Gary Vimr and Paul Marquette for their help.—ANTIC ED.*

# HAPPY COMPUTERS HAS THE SYSTEM THAT OUT PERFORMS ALL OTHERS SUPER BACKUP & WARP SPEED FOR YOUR 810 & 1050

## HAPPY DRIVE ENHANCEMENT

still just **\$149.95**  
for 1050 order number HC1; for 810 order number HC8

The fully working and proven disk drive improvement package. You get: disk backup, high speed write with verify, high speed reading, plus many fantastic features that others only dream about. The 810 version operates in single density with an eighteen sector buffer. The 1050 version operates in all three Atari densities for maximum storage, and buffers up to thirty six sectors! No soldering needed, plug-in installation procedure with complete instructions included. Our WARP SPEED SOFTWARE is included at no extra charge! Over 10,000 units sold! High quality, completely assembled circuit board with gold on connector pins.

## CHEERUP UPGRADE

order number DCU1

introductory price **\$49.95**

Many Atari users agree . . . the HAPPY ENHANCEMENT is superior to the DUPLICATOR. This Hardware upgrade will improve your 1050 DUPLICATOR. You will enjoy all the features that HAPPY ENHANCEMENT owners have. Back up more disks, including those with 34 sector formats; all HAPPY products do this! With HAPPY, there is no need to wait for new features and more development time. Get a fully developed and working system now! Once the CHEERUP UPGRADE is installed, you can no longer use the DUPLICATOR's "User friendly disk software." You probably won't miss it! Instead, you will use the WARP SPEED SOFTWARE package for disk backup and high speed writing and reading that really works. The CHEERUP UPGRADE includes our CHEERUP hardware module (minimal soldering required), our version 7 WARP SPEED SOFTWARE, complete with manual, all features as listed, and installation instructions. Your upgraded DUPLICATOR will be fully compatible with all HAPPY software features and DOS programs. The 1050 CONTROLLER option is NOT easily used with the upgraded DUPLICATOR. Your DUPLICATOR must be functional before our module can be installed.

**NOTE:** The 1050 DUPLICATOR is made by DUPLICATING TECHNOLOGIES Inc., they are not affiliated with HAPPY COMPUTERS.

## COMPLETE 810 HAPPY DRIVE PACKAGE

order number HM1

just **\$219.95\***

The most fantastic offer ever made! A complete disk drive with a version 7 HAPPY ENHANCEMENT installed. This custom case Atari 810 disk drive is made by B & C Computervisions. Fully compatible with the Atari 810; the work-horse of disk drives for Atari 8 bit computers. Comes completely assembled, with power pack, I/O cable, and WARP SPEED SOFTWARE with instructions, ready to use. Not available outside the United States. \*Shipping and handling extra on this item.

## HAPPY 1050 CONTROLLER

order number HC2

just **\$64.95**

For use only with HAPPY ENHANCED 1050 disk drives. Provides convenient control of high speed reading and writing modes. Allows software and front panel switch control of write protect. Prevents writing over valuable data and allows writing to disk flip side. No soldering installation required. Includes indicator LED. Complete instructions on installation and use included. **SAVE!!!** Get the CONTROLLER for \$35.00 when ordered with the HAPPY 1050 ENHANCEMENT.

## WARP SPEED SOFTWARE VERSION 7 (not sold separately)

Included with CHEERUP UPGRADE, HAPPY 810 & 1050 ENHANCEMENT, B & C 810 HAPPY DRIVE package, and 810 VERSION 7 UPGRADE, now at no extra charge! While others try, they cannot match the features of the proven performer that lets you get the most out of your ENHANCED disk drive. Disk based software package includes the following programs: The Menu options program, which displays system status, controls HAPPY drive modes, and selects our exclusive TRACER function. The HAPPY BACKUP and COMPACTOR programs, which back up more Atari software than any other Atari disk drive enhancement, and operate with one or two HAPPY drives. The MULTI DRIVE backup, which uses our exclusive method for simultaneous reading and writing with up to four HAPPY drives, making three complete disk copies WITH VERIFY, in under two minutes. The DIAGNOSTIC, which allows the user to verify proper HAPPY drive performance. The SECTOR COPIER, which provides the fastest single drive disk copying and can be used with RAMDISK, plus a WARP SPEED DOS and other fantastic features. Unlike others, our WARP SPEED SOFTWARE programs are written in machine language, for maximum speed and efficiency.

## SELECT A HIGH SPEED DOUBLE DENSITY DOS

Both of these disk operating systems support the fastest speed with both HAPPY 810\*\* and 1050. With the HAPPY 1050, you get true double density for maximum storage. WARP SPEED DOS XL is HAPPY's own version of OSS DOS XL. It offers the best memory utilization for the more technically oriented user. WARP SPEED DOS XL ordered alone is \$29.95, order number HC4. TOP DOS version 1.5 is menu driven, and is better suited for those that have only one disk drive, or are less technically oriented. Since only TOP DOS supports the medium ("enhanced") density, it is better suited for those with more than one 1050, but only one HAPPY 1050. Only the HAPPY 1050 will operate in true double density. TOP DOS version 1.5 ordered alone is \$39.95, order number HC6. **SAVE!!!** Take half off the price of either or both DOS programs when you order these with any other item (not DOS) in this ad. \*\*810 HAPPY must be version 7 compatible to use these DOS programs at high speed; see below.

## 810 VERSION 7 UPGRADE

This hardware module updates older 810 HAPPIES to have our newest features. This upgrade permits these units to be compatible with the version 7 software and high speed DOS programs. This is the only hardware upgrade we have ever required, and with all the new features added, it is well worth the step upward. (Call or write our office to order.)

## INFORMATION AND SERVICES

All our products are fully compatible with all Atari 8 bit computers. We offer installation of any product we sell. We offer a repair service for disk drives equipped with our products. Call our office number for details.

**24 HOUR INFORMATION MACHINE** At HAPPY COMPUTERS, you can talk directly to the product designer! Our office hours are 9 a.m. to 5 p.m. Monday thru Friday, Pacific time. You can also call our 24 hour information machine (408) 778-6092 for after hours help, other specials, and discount prices.

**ORDER TOLL FREE IN THE USA** If you know exactly what you want to order, and do not have any questions, you can save the price of a phone call by using our toll free order service for MASTERCARD / VISA or COD orders. The toll free number does *not* connect you with our office. They CANNOT answer any questions accurately. They can only take your ordering information. Have your order numbers and credit card number (if using credit card) ready, and call (800) 538-8157 outside California, or (800) 672-3470 inside California; ask for extension 817 to place order. You must provide

the address of the credit card holder. The toll free number operates 6 a.m. to 12 midnight Monday thru Friday, and 8 a.m. to 8 p.m. on weekends, Pacific time. It takes several days from the time you place your order on the toll free line until your order reaches our office and is processed.

**FOR FASTEST RUSH DELIVERY SERVICE** Call our office directly. We can help with all the answers to your questions, and will process your order immediately! Our office phone is (408) 779-3830.

- ALL PRICES except disk drive include shipping in the U.S.A.
- NO EXTRA CHARGE for credit card or COD
- FOREIGN ORDERS add \$10.00 for shipping
- CALIFORNIA RESIDENTS add 7% sales tax
- QUANTITY & OTHER DISCOUNTS available

## I/O Board

### TURN C INTO PASCAL?

As a new C programmer wishing to learn the already hard subject of interfacing C into GEM, I do not appreciate your published C source code filled with **#defines** that turn it into "Pascal." Will you ensure that any future C source code is straight C and not **#defined** to the hilt into some "other" language?

Ralph E. Freshour

*Different programmers write programs in different ways. The person who programs for us in C feels the operator set in C can be (and is often) abused until the program becomes unreadable. Also, it seems the majority of people reading The ST Resource know some BASIC or PASCAL, and are encountering C for the first time. Since C allows its operators to be re-defined, they get changed from the curly brackets to "begin...end" or "for...next", or whatever is applicable. However, we have a simple solution for you. Type in the code as it appears in the magazine, then run your source code through CP68.PRG, and the file it puts out (yourfile.i) will contain pure, clean C source code without any **#defined** Pascal in it anywhere.—ANTIC ED*

## Help!

### MENU MAESTRO

If *Menu Maestro* (January 1987) is "freezing" your XL or XE keyboard, just add the following line for a quick thaw:

```
150 IF PEEK(65521)=2 OR  
PEEK(65521)=1 THEN
```

```
A$(100,100)="Q":A$(101,101)=  
CHR$(251)
```

The TYPO II Code for this line is SY.

*Antic welcomes your feedback, but we regret that the large volume of mail makes it impossible for the Editors to reply to everyone. Although we do respond to as much reader correspondence as time permits, our highest priority must be to publish I/O answers to questions that are meaningful to a substantial number of readers.*

**Send letters to: Antic I/O Board,

CA 94107.**

# ATARI 400, 800, XL & XEs . . .

# YOUR RAOS™

## HAS ARRIVED

and for just

# \$49.95

(Save more  
when purchased  
with new  
SuperRAT)

Save \$20 extra  
when you purchase  
RAOS with our new  
2-button digital  
SuperRAT for just \$99.90  
(\$119.90 if bought separately)

After extensive development and 16-bit GEM technology application, RAOS (Rat Actuated Operating System) is now ready for 8-bit Atari computers. Using efficient memory management and data manipulation, RAOS creates a powerful windowing environment, yet uses an incredibly small amount of memory.

**It totally transforms your computer.** Your Atari's operating system now has the GEM features of the ST, like a mouse-controlled arrow-pointer, which is used to open the pull-down menus or select icons, or open multiple screens or windows, all at the click of a RAT button!

**All this for an incredible price.** RAOS is the most powerful windowing environment for any 8-bit home computer on the market, and its very low price makes it available to all Atari owners.

**We designed RAOS around you.** Routines such as the mouse controller make using the digital SuperRAT in your own programs as simple as a single PEEK command! Our DESKTOP program Z-DOS, included in RAOS, lets you access your disk files with ease, replacing keyboard input with icons and the arrow-pointer, just like the MacIntosh™ and ST systems. RAOS also can use the original RAT.

**And we improved our RAT, but kept the price low, low, low!** The new SuperRAT is a digital mouse with infinite resolution and accuracy. We gave it two buttons and a rubber-coated ball for better feel and response. It even matches the color of the computer. And it's available with ACCU-DRAW for only \$69.95, or in the SuperRAT/RAOS system for only \$99.90!

Order now by M. O. or C. O. D. for pre-Christmas delivery!

THE ST QUARTERLY

... "Printer Drivers The Easy Way: A DEGAS Printer Driver Maker Program" and Ray-Tracing Construction Set." ST programming wizard Tom Hudson gives you a do-it-yourself, custom printer driver maker, and takes you behind the scenes on the creation of his spectacular ray-tracing demo, "Steelyboink!" (Available on Antic ONLINE.) In addition, he presents a program to let you do your own ray tracing demos!

... Straight from the hacker front lines—ST soldiers Dave Small and Dan Moore teach you the ins and outs of hard and floppy disk drives. They also present these incredible utilities: The Twister Floppy fast formatter, the Meg-A-Minute hard disk backup, the hard disk write protector, the Reboot, and the famed Reviver.

... Professional artist Darrel Anderson shows you how to capture your ST's colorful graphics, using a *black and white* dot matrix printer, in the article "Black And White in Color."

... Let musician and programmer Tom Jeffries lead you through the arcane mysteries of the MIDI interface in "the Ins, Outs, and Thrus of MIDI."

... And a wealth of other surprises to help you get the most out of your ST!

## **LDW BASIC — NEW REVISION! FOR ATARI 520/1040 ST**

**EASY TO USE!** For the beginner, or the professional. Just type in any Atari ST Basic program, either your own or a magazine's, then impress your friends by making it run like a professional program with LDW BASIC! With LDW BASIC there's no need to learn 'C' or Pascal, because LDW BASIC is just as powerful, and the Basic Language is much easier to use. LDW BASIC is also up to 500 times faster than ST BASIC (supplied by Atari) and generates a program (PRG) file that can run from the Desktop.

Newest revision 1.1 includes: Full Atari ST compatibility. Compiles Basic programs created under any editor. Double and single precision floating point numbers. Hooks to GEMDOS, BIOS and GEM. Generates a stand alone .PRG file. True random file. True dynamic arrays (no limit on array size), symbolic labels, graphic and sound calls supported. Plus, many more enhancements. Not copy protected! No license fees!

# IF YOU CAN FIND A BETTER ATARI ST PROGRAM WE'LL BUY IT FOR YOU!

Full GEM interfacing, convenient Quick Keys, and many other unique features of our own.

## WORD WRITER ST with Spell Checker

A full-featured, professional word processing system for home and business use. You get:

- A Continuous Spell Checker that identifies misspelled words as you are typing your document.
- An additional 85,000 word, built-in Spell Checker that checks your entire document – at your command!
- On-Screen underlining, italics and boldface – as you write.
- An Outline Processor that quickly organizes notes, facts, and ideas in convenient outline format.
- Every other feature you'll need for everyday word processing, plus most of the features found in more expensive programs.

**With Timeworks you get more than software. . .**

**You Get Our Customer Technical Support Team** – free to all registered users.

## DATA MANAGER ST with Report Writer

A complete general information Storage and Retrieval System with report writing, business graphics, and label making capabilities. Plus, you get:

- Flexibility that allows you to modify your data base structure by changing the size or position of fields of information – at any time.
- A complete Report Writer that generates customized data reports. You specify the title, location, and sequence of each column.
- An extensive Business Graphics Package with pie charts, bar charts, line plots, point plots, hi-lo-close stock price plots, and more.
- A Label Maker that prints your important information onto all types of labels.

**With Timeworks you get our Money Back Guarantee\***

If you can find anything that works better for you – and it's available – we'll buy it for you. Details inside every Timeworks package.\*\*

## SWIFTCALC ST with Sideways

A state-of-the-art spreadsheet for home and business use. You get:

- 8192 rows and 256 columns provide up to 2,048,000 cells (locations) in which to place information.
- Super Graphics graphically display and print out business information using pie charts, bar charts, line plots, point plots, hi-lo-close stock price plots, and more.
- Windows allow you to work on two sections of your spreadsheet simultaneously.
- Sideways lets you print all columns on one continuous sheet . . . sideways.
- Help Screens, help you use the program – without referring to your manual.
- Formatting – Choice of five formats: Decimal (up to 9 places); Graphics; Exponential Notation; \$ Sign & Commas.

**You Get Our Liberal Upgrade and Exchange Policy** – Details are inside every Timeworks package.

**More power for your dollar**

# Vectron

*Atomic arrow strategy game*

*Manipulate atomic particle blasters and energy deflectors to destroy more targets than your opponent. This strategic marksmanship game is Antic's second offering from the author of Cliffhanger (Antic, November, 1986). The BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.*

**Y**our Atari starts Vectron by randomly placing a playfield of 50 energy deflectors (arrow-shaped targets) within a border of atomic containment gutters. Opposing atomic particle launchers are at the left and right sides of the field. These two launchers can move up or down. The scores of each player and the number of deflectors remaining are displayed at the bottom of the screen.

Arrangement of the energy deflectors is crucial to the game. Movement of launched projectiles is controlled by the directions in which deflector arrows point. For example, if your projectile is hurtling horizontally across the field and strikes a deflec-

tor arrow pointing *up*, the projectile starts moving upward. At the same time, it blows up the deflector and increases your score by one point.

You win by destroying more deflectors than your opponent. Naturally you want to keep your projectiles in play as long as possible. You do this by finding lengthy "chains" of targets, which will usually make your projectile change direction constantly.

Spend time analyzing the field's target setup before you do anything else during your turn. See which deflector directions and positions will do you the most good. Always look for a new chain, because the playfield is constantly changing. Don't rule out isolated deflectors—they just might

get you into a chain that looked inaccessible.

### FOUR PHASES

Each player's turn is divided into four phases. During the first phase, the message DEFLECTOR TYPE appears at the top of the screen. Push your joystick in the direction of an arrow that you want to put into play. That arrow direction will be displayed at the top of the screen. Press the joystick button to move to the second part of your turn.

You are now ready to position the deflector. An *inverse* image of your deflector appears in the middle of the playfield. Use your joystick to move the cursor to the desired position and press the joystick button. But only a buzzer will sound if you try to lay one deflector over another.

You only get to add one deflector during your turn, so you must make sure to place it where it will do you the most good.

Next, move the atomic particle blaster up or down with the joystick. When it is lined up properly, press the joystick button to launch a projectile. The projectile keeps moving in one direction until it hits a deflector.

If the projectile strikes a blaster it will reverse direction—and the blaster disappears until the next turn. So don't hesitate to use your opponent's blaster (or even your own) to keep a chain going.

When the projectile hits a containment gutter, it will roll off the screen and your turn is over. Turns continue until there are no targets left. Whoever has the highest score gets a musical victory salute from Vectron.

### TYPING VECTRON

Type in Listing 1, VECTRON.BAS, check it with TYPO II and SAVE a copy. If you have trouble typing in the special characters in lines 575 and 581, leave those lines out. Instead, Listing 2 will make a disk or cassette file called LINES.LST that creates those lines for you. LIST a copy of Listing 2 after you check it with TYPO II. Now type NEW and LOAD Listing 1, then ENTER the file created

by Listing 2. Make sure you SAVE a copy of the merged program before you RUN it.

To change the number of targets at the start of the game, change the 50 in line 540 to the number you want. Having more than 99 targets will slightly affect the second player's score display.

To increase the speed of the projectile, remove the FOR/NEXT loop from line 60. To decrease the speed, *increase* the number in that loop.

### PROGRAM TAKE-APART

Lines 10-20—Jump to initialization routines.

40-100—Establish the initial position of projectile, add to the horizontal and vertical positions of projectile and check for collision with gutter or deflector.

120-140—Indicate player turn and adjust the variables accordingly.

160-180—Check trigger for projectile launch and joystick for launcher movement.

200-230—Check trigger for deflector type selection and display deflector options according to joystick input.

250-320—Check joystick for cursor movement and check trigger for selection of deflector location.

340-380—Display projectile rolling down gutter.

400—Display scores and targets left.

420-480—Display game over, scores and winner, play victory tune and display Play Again option.

500-540—Initialize the variables and create the playfield.

560-590—Display the title screen and redefine the characters.

610-630—DATA for shapes.

650—DATA for tune.

*Heath Lawrence lives in Port Elgin, Ontario, and has been programming on his Atari 800 for nearly five years. His game Cliffhanger appeared in the November, 1986 issue of Antic.*

# On the Road to Moscow . . .

As the German Wehrmacht approached the open steppes around Smolensk, the invasion of the Soviet Union was on schedule. At this rate, the army would capture Moscow and throw the Russians out of the European continent by the time the snows fell.

At the head of the Panzergruppe invading central Russia was General Heinz Guderian, the man who turned the potential of armor into the reality of Blitzkrieg warfare. Opposing him were masses of Soviet infantry and armor determined to defend their homeland, but untried in battle. With Guderian's armor and motorized infantry divisions approaching the ancient city, the stage was set for another encounter with the Nazi juggernaut.

**Guderian** simulates this critical campaign of WWII, using the acclaimed joystick-driven system from Gulf Strike. On the full-color scrolling map of central Russia, the German player must master Blitzkrieg tactics to encircle and overrun Soviet divisions and drive deep enough into Russia to make the capture of Moscow possible. At your command are infantry divisions, panzer regiments, motorized infantry, panzergrenadiers, even the 1st German Cavalry Division.

The Soviet player must work to counter the German threat, and make attacks capable of cutting off supply to the forward units. While your army is massive, it is also untrained. Soviet units begin play with a hidden strength revealed only at the moment of combat. Uncertainty is always present. The game becomes a tense contest as German units blunder into Soviet strongpoints, while Russian attacks can suddenly turn into a rout.

**Guderian** has a *solitaire option* allowing you to take command of either the German or Soviet armies, as well as overrun attacks, supply rules, Soviet leaders, rail movement and optional reinforcements. The rulebook introduces new players to historical gaming, explaining clearly concepts such as zones of control, supply, combat and movement. Planning map included.

The battle for Moscow was lost on the fields of Smolensk. Now is the time for you to re-create (and rewrite) history with **Guderian**.

**COMPLEXITY:** Intermediate

**SOLITAIRE SUITABILITY:** Very high

**TIME SCALE:** 2 days per turn

MAP SCALE: 10.5 km.

**UNIT SCALE:** Regiments and divisions

**PLAYERS:** One or two

**PLAYING TIME:** 1½ to 3 hrs.

**Guderian** has a full color joystick driven map display which easily allows commands to be executed

**Guderian is ready to run on your Atari® 8-bit, Apple II® family or Commodore® 64/128 home computer.**

## - **Flight Simulator II** - **Scenery Disks**

### **The Challenge of Accomplished Flight**

With a realism comparable to (and in some ways even surpassing) \$100,000 aircraft flight simulators, Flight Simulator II includes full flight instrumentation and avionics, and provides a full-color out-the-window view. Instruments are arranged in the format standard to modern aircraft. All the radios needed for IFR flight are included. Front, rear, left, right, and diagonal views let you look in any direction. Program features are clearly documented in a 96-page Pilot's Operating Handbook.

For training in proper flight techniques, Flight Simulator II includes another 96-page instruction manual, compiled by two professional flight instructors with over 8,000 hours flight time and 12,000 hours of aviation teaching experience. You'll learn correct FAA-recommended flight procedures, from basic aircraft control through instrument approaches. To reward your accomplishments, the manual even includes a section on aerobatic maneuvers.

### **The Realism and Beauty of Flight**

Go sight-seeing over detailed, realistic United States scenery. High-speed graphic drivers provide an animated out-the-window view in either day, dusk, or night flying modes.

Flight Simulator II features over 80 airports in four different scenery areas: New York, Chicago, Seattle, and Los Angeles. Additional Scenery Disks covering much of the United States are now available for all computer versions of Flight Simulator II.

Each disk covers a geographical region of the country in detail, and is very reasonably priced.

### **The Pure Fun of "World War I Ace"**

When you think you're ready, you can test your flying skills with the "World War I Ace" aerial battle game. This game sends you on a bombing run over heavily-defended enemy territory. Six enemy fighters will attempt to engage you in combat as soon as war is declared. Your aircraft can carry five bombs, and your machine guns are loaded with 100 rounds of ammunition.

**See Your Dealer.** Flight Simulator II is available on disk for the Apple II, Atari 800/XL/XE, and Commodore 64/128 computers for \$49.95. Additional Scenery Disks are \$19.95 each. A complete Western U.S. Scenery six-disk set is also available for \$99.95. For additional product or ordering information, call (800) 637-4983.

# Word Searcher

## Atari power finds the winners

BY KEVIN PECK

A word search contest in my local newspaper inspired me to develop this program. Each week, a few of the names of the contest's 114 sponsors were hidden in a grid of letters. No clues were given about when any sponsor would appear, so it took a lot of trial and error to solve the puzzle. I decided that my Atari should do this dirty work for me.

Word search contests are fairly common newspaper promotions. So if you'd like your 8-bit Atari to put you ahead of the pack next time such a contest appears in your hometown paper, type in Listing 1, WORD-FIND.BAS. Check it with TYPO II and SAVE a copy before you RUN it.

I have also provided two puzzles for you to try with the Word Searcher program. Listing 2, PUZZLE2.DAT, contains various Atari computer terms. Listing 3, PUZZLE3.DAT, has a variety of words. These listings are both included on the monthly disk.

Type in Listing 2 or 3 and check it with TYPO II. Then LIST it to disk or cassette. Type NEW to clear memory, LOAD Listing 1 and ENTER Listing 2 (or 3). This creates a ready-to-RUN program. When you are through with the first sample puzzle, repeat this process with the listing for the second sample puzzle. Be sure to save a copy of Listing 1 *without* any puzzles merged in, so you can use it with any puzzle you want.

*With Word Searcher, just type in the letter grid from a word-finding contest grid, give your Atari the list of words to be searched, and the computer will find them in a flash. This BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.*

You can use Word Searcher with any printed puzzles, or with ones that you create yourself. Deciding if the program can handle the puzzle is simple. A puzzle grid can be no larger than  $24 \times 24$  letters. (This is actually imposed by the screen size of the Atari, not memory space.) The word

list can be any size.

## PUZZLE DATA

The first DATA statement of your Puzzle Program *must* contain the width and height of the puzzle. In the first sample puzzle, the first DATA state-

continued on next page

ment reads DATA 24,24. The second sample puzzle is eight letters wide and 10 letters tall, so the first DATA statement reads DATA 8,10.

The next DATA statements contain the puzzle grid itself. Each statement must have the same number of letters as the width of the puzzle. And the total number of DATA statements must equal the height of the puzzle. Otherwise an error will be generated.

The following DATA statement will tell the program how many words to search for. The DATA statements after this contain the words themselves.

Do not type spaces within words. For example, one of the search words in the first sample puzzle is really two words: DISK DRIVE. But in the DATA statements it appears as DISKDRIVE.

If there are fewer words in the DATA than you have allowed for in the word count, the program will still search for the given number of words and then tell you it has unexpectedly run out of words. This causes no problems, but you should try to avoid it. If you have more words in the DATA than you tell the program, it just won't search for unaccounted-for words.

When you RUN the program, your grid of letters appears on the left side of the screen in a blue box. The right side has the command area. The top box displays the number of words found and missed so far. The next box contains the word being searched for. The third box is the message box, which says when a word is found, not found, too long for the puzzle, etc. The bottom box shows what keys to press when needed.

The cursor moves through the grid looking for the first word in the list, highlighting it in inverse video when found. You then can press either [START] to continue or [OPTION] to quit. You should now circle the word in the puzzle you're working on and then press [START] to continue with Word Searcher.

When the program finishes searching the entire word list, the background turns black and the word "Finished" appears in the command box.

If a word isn't found, either you've misspelled the word in the word list

or a letter in the puzzle grid DATA is incorrect—or the puzzle you're using has a typo. The program will tell you it can't find a word and the screen will turn red. Exit by pressing [OPTION].

## PROGRAM TAKE-APART

You might wonder how I got two colors on the screen in Graphics 0 and used them all over the screen. You've probably seen it done using display list interrupts, but that only works for splitting the screen horizontally. The only way to split it horizontally in some places and vertically in others is to use Player/Missile graphics along with the normal screen display. I only needed three players to achieve the desired effect. And notice how the blue box surrounding the puzzle grid shrinks or expands to cover just the puzzle grid itself.

The smallest area a player needed to cover was an 8×8 pixel block, the size of one Graphics 0 character. I used double resolution players set to quadruple width. When all bits are set on in a player's data stripe, it covers eight characters on the screen—equal to one character width per bit.

*(For learning more about Player/Missile graphics, two helpful books would be Ian Chadwick's Mapping The Atari and Lon Poole's Your Atari Computer.—ANTIC ED)*

The program scans the puzzle, one letter at a time, starting with the upper left corner. When it finds a letter in the puzzle which matches the first letter of the word being sought, it checks the surrounding letters in the puzzle for a complete match.

Let's look at how the loops within the program perform this task. The I loop starting at line 270 is the main outer loop. It READs a word from the list and makes sure the word isn't too long to fit in the puzzle. Over-long words are printed in the command box.

The X and Y loops move the cursor through the grid, highlighting each letter as it scanned. This is done by using the LOCATE command to get the screen RAM value of the letter, adding 128 to set bit 8 on for inverse video and finally PLOTting the letter back to the screen at the same spot.

You usually do not consider using the PLOT, LOCATE and other graphics commands in Mode 0, but they work here just as they do in any other graphics mode. For the commands to work properly, you must turn the cursor off beforehand by POKEing 752,1. Turn it back on with POKE 752,0 before exiting the program.

If the first letter of the search word doesn't match the letter at the current grid position then it skips the next set of loops and moves on to the next letter in the puzzle grid.

If the first letter *does* match the grid letter, the area around that grid position is searched to see if the rest of the word is there. Here's where the DX and DY loops come in. These loops give nine possible values, of which eight are valid. The ninth value occurs when DX and DY are both 0, which means we're not going anywhere—so we skip over the subroutine call to the NEXT line and try the next valid set of values.

For each pass of the DX/DY loop pair we enter the subroutine starting at line 80, which makes sure the word will fit in the puzzle going in the direction indicated by DX and DY. If a 10-letter word is being searched and we're in grid position 18, then the word won't fit going to the right. There's no need to check anything else with this set of directions. We also perform the same check for vertical words.

If the word fits, we must check, character by character, against the grid in the current direction. As we look we will set each character in the grid to inverse video. No match means resetting all matched letters to normal video and exiting the subroutine. We then continue searching in the next direction.

If the check is successful, the user is informed of the find by a message in the command box and the screen turning green.

*Kevin Peck is currently in college studying computer science. He has written various programs for business in Salina, Kansas.*

## ATARI 520 ST/COLOR GAMES

**FRACTALS:** Generate amazing op-art like images in spectacular colors. Zoom in on the Julia curves by up to 100 million times by pointing and clicking! Travel in this beautiful space and enjoy an inexhaustible family of fractals. A typical fractal (131\*161 dots) takes about 10 minutes to generate, but you can make pseudo-fractals in about 10 seconds!

**MAZE:** Develop and test your skills at showing the path through mazes. This program generates random mazes of six different sizes/complexities, and will show you the path if desired.

**TINGO:** You and your opponent alternate placing dots on a checkerboard to get five dots in a row. Play against a friend or the computer. The computer has six different skill levels, and will always respond immediately. A man versus artificial intelligence game!

**BONGO:** Find the hidden symbols/colors as in a battleship game. Test your reasoning/ deductive skills with this laid back teaser! 20 game modes.

**CULTURE:** You have to be fast and accurate using the mouse to prevent the Reds from taking over... 36 different game settings to challenge your eye to hand skills!

### PRICING:

1 Program \$20-  
2 Programs \$35-  
3 Programs \$46-  
4 Programs \$54-  
5 Programs \$60-

All of the programs are fully mouse and menu driven, and have a special demonstration mode to show capabilities and to entertain. They are written in Pascal for fast and robust operation. The executable code is supplied a low density floppy disk (3.5/SS/135TP), and comes with a 3 month warranty. Archival copies allowed.

The **eStE Clock** by  
**BigFoot Systems**

2708 E Lake St Minneapolis MN 55406  
Suite 207 612-722 9515

A computer that uses time and date should keep the correct time and date.

The eStE Clock keeps the time for the Atari 520ST and 1040ST.

Its CLK.ACC program sets the ST system clock when the power is turned on: Now all your new files are dated correctly. Software that uses the date gets the right date.

The eStE Clock plugs into the cartridge slot. Its housing supports itself on the surface on which the ST sits and it is sturdy enough for you to lean on it. It can not be plugged in upside down.

Read about the eStE Clock in Antic, December 86.

Introductory price \$42

Price includes shipping within the 48 states.

P.S. Bigfoot is an orange and white tomcat with a great personality and very big feet.

**and more to come...**

# VIP Professional

**INTEGRATED SPREADSHEET**  
**Finally – A Business Program**  
**With Total Lotus 1-2-3™ Functionality**

## Partial List of Features:

- ✓ Reads & Writes 1-2-3 Files
- ✓ Ultra Fast Floating Point Math
- ✓ Fast Natural Recalculations
- ✓ Twice As Much Spreadsheet Memory
- ✓ Ease of Use from Hard Disk
- ✓ Color Presentation Graphics
- ✓ Mouse Controlled
- ✓ Sparse Matrix
- ✓ Full Printer Control
- ✓ Faster Screen Update
- ✓ Macro Application
- ✓ Multiple Windows
- ✓ 256 Columns x 8192 Rows
- ✓ Searches, Sorts, Compares
- ✓ Icons – Pull Down Menus
- ✓ Instant Help on Screen
- ✓ Combine & Extract Files
- ✓ Powerful Data Base Manager

\*Although most features are common to these computers please check with dealer for features that are exclusive to your special computer.

## SPECIAL FEATURES FOR APPLE IIe/c

- \*Full Blown Mac Style Interface
- \*Up to 4 Megabytes of Usable Memory

VIP Professional is a state-of-the-art integrated spreadsheet program which brings together a spreadsheet, database, and graphics capabilities, modelled after the powerful and best selling Lotus 1-2-3 Program which dominates the business world and is acclaimed to be the most powerful spreadsheet in the world.

VIP Professional and VIP Professional LITE are trademarks of VIP Technologies Corp.; Lotus 1-2-3 is a trademark of Lotus Development Corporation; Atari ST is a trademark of a Atari Corp.; Apple is a registered trademark of Apple Computer Inc.; Amiga is a trademark of Commodore Amiga Inc.; GEM is a trademark of Digital Research.

# Rainbow Screen Customizer

*Flashy displays for your programs*

BY JAMES HAGUE

**A**tari 8-bit computers are equipped with a palette of 128 vivid colors (Or 256 with a bit of programming gimmickry. See *GTIA Rainbow* in the March, 1984 *Antic*.) This is far more colors than most computers boast. Why then do Atari programs usually use only one or two colors, ignoring all that power? Because, in BASIC, it's difficult to have more than four colors on screen at once. To make matters worse, Graphics Mode 0 seems to be the most popular mode, and it's usually limited to three colors.

But now you can bypass these color barriers with user-friendly Rainbow Screen Customizer. This program lets you make each line of a Graphics 0 screen any of 128 distinct colors—allowing up to an amazing 24 colors in all, and that's not even counting the border. Rainbow Screen Customizer also generates a BASIC subroutine that will recreate your own 24-color screen in any BASIC program.

## HOW IT WORKS

Type in Listing 1, SCREEN.BAS, check it with TYPO II and SAVE a copy before you RUN it.

To edit the colors of a GR. 0 screen, choose option one, View/Edit Screen, from the main menu. Move the joystick until the arrow is on the line that you want to edit. (The text on the screen will not be saved with your finished product. It's only there to help you design your color pattern.)

Press [START] to select one color for that line from a possible 16, holding it down to cycle through the available colors. The [SELECT] key changes the luminance of the current

*Rainbow Screen Customizer expands the color palette of Graphics 0 screens in your own programs to 24, instead of just the three colors usually available in this popular graphics mode. This BASIC programming utility works on all 8-bit Atari computers of any memory size.*

line to one of eight brightness levels. [OPTION] selects the character luminance for the line, also allowing eight settings. When you are satisfied with your colorful creation, a quick press of the joystick button recalls the main menu.

There are a few things to be aware of about the color combinations available. First, setting both the character luminance and line luminance to the same value renders any text on the line—including the arrow—invisible. Another important point is that the color of the characters cannot be cho-

sen directly. Instead, the characters usually assume a shade relating to the line color. Except for these minor snags, you can mix and match colors to your heart's content.

## USING CUSTOM SCREENS

A colorful screen is nice to look at, but what good is it unless you can spice up your latest programs with it? Imagine being able to divide the screen into separate horizontal color-coded windows, each having its own special function. For example, to

*continued on next page*

bring attention to a message area at the bottom of the screen in a word processor, you could color it a vivid red. Applications like this are the purpose behind this program.

Programming a colorful screen from scratch is not a task for the faint of heart, but with Rainbow Screen Customizer it's a snap. You don't even have to understand how it works, just how to use it.

To create a BASIC subroutine that allows easy access to your customized screen, choose option two, Create Subroutine, from the main menu. You will be asked to enter the line number in your main program where you want your routine to start, and the line increment. (Entering 1000 and then 10 would start the subroutine at line 1000, with the next line being 1010, etc.)

Finally, enter a filename for the subroutine. The file will be in LISTed format, so use .LST as the extender to remind you. Then insert a formatted disk of any density, press a key, and sit back and relax while your subroutine is created automatically.

Now exit the program by choosing option three and LOAD the program to which you want to add the subroutine. Then ENTER the file you just created. You now have a subroutine to create a custom screen included as part of your program. If you want to LOAD the subroutine into memory by itself, type NEW and then ENTER it.

To access the custom screens within your own BASIC program, just GOSUB to the first line of the subroutine. This will take about two or three seconds to set up, after which a brand new GR. 0 screen will appear with the colors you have chosen.

The custom screen is disabled whenever a GRAPHICS command is executed, but another GOSUB brings it back. Fortunately, the subroutine is "intelligent"—if it's called more than once, it will "realize" this and set things up more quickly.

While the custom screen is enabled, the color registers will have no effect, except for the one that controls the border. A pre-defined variable, CTRL, lets you easily enable and disable the multi-colored screen at will.

POKE CTRL,1 turns the screen on and POKE CTRL,0 turns it off. When disabled, the entire screen takes on the characteristics of line 0, but the color registers are active again.

## WHOOOPS!

I have run into two minor glitches with this program. But if a colorful screen is what you need, these restrictions should be easy to work around.

First, the keyclick sound interferes with custom displays created by Rainbow Screen Customizer, making the screen shudder whenever a key is pressed, as well as making the click sound more like a quack. XL/XE owners can easily turn off the keyclick sound with POKE 731,255 and turn it back on with POKE 731,0. But 400/800 diehards don't have such an obvious solution. Probably the best way around it is to write a custom routine using memory location 764 to access the keyboard. But, on the other hand, the latest trend in programming is software that doesn't require the keyboard, so why not stick with your joystick?

The second problem is common to many programs involving machine language subroutines. The machine language used by this program, as well as data needed by it, is stored in a section of memory known as Page Six, which starts at location 1536. If you are using other pre-written machine language routines, make sure they don't occupy the same memory space.

With the Rainbow Screen Customizer you can create professional-looking BASIC programs that surpass the two-color displays found in many commercially available software packages. Of course, looks are just one part of a program, but they can make the difference between a mediocre piece of programming and one that is truly outstanding.

*James Hague's most recent Antic program was Uncle Henry's Nuclear Waste Dump, (December, 1986). He lives in Richardson, Texas and has been working in assembly language and BASIC for over four years.*

# 8-Bit

## PRACTICAL PROGRAM ★★ CONTEST ★★

### First Prize Atari 1040ST Computer (Provided by Michtron)

**Plus \$500 worth of Batteries Included ST software**

#### Three Runner-Up Prizes; Antic 1-Year Disk Subscriptions

**A**lso, any entries (including prizewinners) accepted by Antic Magazine will be paid at our standard authors' rate, upon publication.

**HOW TO WIN** We are looking for the most powerful, versatile, easy-to-operate programs that perform useful jobs in the real world. The more uses for your software, the better. For example, a stuffed-animal database for taxidermists would probably be considered too specialized by the magazine's judges—no matter how excellently it is programmed.

The winning software must be user-friendly, most likely menu-driven wherever possible. Users should not need programming knowledge in order to successfully operate the application programs.

Please note that some of the other popular Atari program categories—such as utility routines that add power when inserted into your own programs—cannot properly be considered applications. Practical application programs should be complete, stand-alone software that does an entire user-controlled job from start to finish. For example, a drawing or painting program would be a practical application—a colorful graphics demo would not!

**TECHNICAL RULES** Programs must run on the Atari 800, 800XL and 65XE models and require no

more than 48K memory. However, programs that *also* take advantage of the extra memory in the 130XE will be given preference.

Programs must be written in standard renumberable Atari BASIC or MAC/65 assembly language, under a disk operating system compatible with Atari DOS 2 or 2.5. Program listings cannot be larger than 150 sectors of a single-density disk.

Thorough error-trapping is very important. Your program should not crash every time a user accidentally presses the wrong key. And please do not include authors' copyright statements in your listing.

**JUNE 15, 1987** All entries in the Antic 8-Bit Practical Applications Competition must be received by June 15, 1987. Winners will be announced in the November, 1987 issue of Antic. Judges' decisions are final.

Entries—programs and accompanying articles—should be submitted on disk *and* in printout. Entries will be returned only if the author provides a stamped, self-addressed envelope.

Send entries to:  
Practical Applications Competition  
Antic Magazine  
524 Second Street  
San Francisco, CA 94107

All 8-bit practical application programs accepted for publication by Antic between November 1, 1986 and June 15, 1987 will also be automatically evaluated as potential prizewinners in the contest.

# Today's Atari Corp.

## *A close-up look inside*

BY NAT FRIEDLAND, ANTIC EDITOR

**R**eaders of **Antic** have always been curious about what goes on inside the Atari company and how it develops new products. Now, for the first time, this valid curiosity can be satisfied. **Antic** editors were recently admitted into Atari headquarters and allowed to take photos anywhere in the building, and even to record conversations with engineers and programmers.

Strange as it may seem, this welcome for **Antic** to report on the entire Atari facility marked a historic first. The previous Atari management was quite secretive, to put it mildly.

For example, when **Antic** first began publishing in 1982, Atari Inc.—then a division of Warner Communications—was not immediately enthusiastic about this magazine printing the word “Atari” on the cover as an explanation of what computer we were publicizing.

Although **Antic** gradually developed accurate and detailed information “sources” inside the old Atari, we were never officially given any special consideration for advance information—even on technical topics which would only be of interest to hardcore Atari enthusiasts such as **Antic** readers.

During the heyday of the old Atari, around 1982, the company had approximately 10,000 employees worldwide and some 70 buildings all over Silicon Valley. The fastest-growing company in the history of American business, Atari dominated the international videogame market and grossed \$2 billion in one year.

Today, after surviving the most spectacular losses in the history of American business, The Silicon Valley presence of Atari Corp. consists of a single Silicon Valley building with about 200 employees. Worldwide, Atari now has 1,000 employees and an assembly factory in Taiwan.

However, the company is still setting records. Atari is clearly “the Chrysler of high-tech, the biggest comeback story in the history of the computer industry”—exactly as predicted in the September, 1984 **Antic** (page 7). At this writing, Atari just went public for the first time with a stock issue that sold \$51 million in one day.

### THE NEW ATARI

When Jack Tramiel took over Atari in June 1985, with a team including many of his former Commodore management associates and his three

sons, the flow of information steadily became freer. In mid-November 1985, the newly renamed Atari Corporation broke the ice with its first press conference—which included an exclusive **Antic** interview (February 1985, page 72)—announcing that the 130XE and the 520ST would be unveiled at the January 1985 Consumer Electronics Show.

**Antic** even got a private preview of the new computers the day before they were shipped from Silicon Valley to the CES (April 1985, page 17). But although the new Atari management team was a lot more accessible than the previous executives had ever been, they still left no doubt that developing the new Atari computer models and establishing them in the marketplace was a much more urgent priority than telling Atari's story via the press.

But now, with the success of the ST and XE computers an established fact, Atari has become more open than ever before. For the first time, **Antic** was permitted to use cameras and tape recorders throughout the entire Atari building—although we did agree in advance that we wouldn't photograph incomplete products if re-

continued on next page

quested by Atari. The following is a report of what we saw and heard at today's new Atari Corp.

## ON TO SUNNYVALE

Low, wide and modernistic, 1196 Borregas Avenue used to be one of the *two* Atari headquarters buildings on this street in Sunnyvale. It is surrounded by a vast tract of similar high-tech company buildings that are typical of Silicon Valley's corporate architecture.

Sunnyvale is just about at the center of Silicon Valley, which is generally considered to extend from San Jose to Palo Alto, roughly 40 miles south of San Francisco. This section of Borregas Avenue dead-ends into Highway 101, Silicon Valley's main expressway, just south of Moffett Air Force Base with its giant hangars and the "Blue Cube" center for electronic tracking of satellites.

Turning into the parking lot at the Atari sign, about one block from Highway 101, I pull into a visitor's space and meet **Antic** ST Program Editor Patrick Bass in the lobby. The front desk is manned by a receptionist and a security guard. We sign the login sheet and are issued visitor's badges.

Our guide arrives, Neil Harris, Atari's Marketing Communications Director (See the February 1987 **Antic** article, *Atari's Own BBS*). After Neil okays our entry with camera and recorder, we follow him through a double door into a sprawling, airy workspace full of employees at desks and modular workstations. "This is a typical Jack Tramiel open work area," comments Harris. "He doesn't like to have employees separated by a lot of little office cubicles."

Harris's office is at the far end of this wing. En route we pass a series of wall maps of the U.S. and the world, with color-coded pins marking the locations of Atari users groups, scheduled Atari Fairs, national and overseas distributors and sales offices.

Neil shows off his advance model of the Print Technik video digitizer. **Antic** has been receiving reports of this super-sharp digitizer from European trade shows for months, but this

is the first unit we have seen in the U.S. Harris has a videocamera set-up by his ST and he takes a headshot of me sitting in front of his desk. (When the disk of this portrait is brought back to **Antic**, Patrick and the technical staff use DEGAS Elite to convert it into a Monty Python cartoon. Very clever, indeed. Too bad the perpetrators are all fired!!)

Next door to Neil's office is the oversized closet that houses the Atari Base bulletin board with its five sets of 520STs, hard disks and modems. Across the way is the desk of Atari Users Group Coordinator Sandi Austin. "Most of the people in this part of the building are in Marketing or they work for Diana Goralczyk in Customer Relations," says Harris. Customer Relations phones are (408) 745-2367 or (408) 745-5759.

We walk through this wing and into the equally large work area on the opposite side of the lobby, where the Accounting Department is housed. Throughout this floor, it is striking how many STs are in use on people's desks.

"ST computers have pretty much replaced terminals, telexes and other micros throughout the company," says Harris. We use dbMan for our order processing database in customer service inventory. STs track the sales for our executives like Mike Katz, Sales-Marketing Vice President; Augie Ligouri, the U.S. General Manager; Ian Kennedy, our General Manager in Canada. Atari secretaries use ST Writer for word processing. Greg Pratt, the Finance Vice President, uses the VIP Professional spreadsheet. We're replacing all our mainframe terminals with STs—using either Atari's new DEC VT100 Terminal Emulator Cartridge or PC InterComm software from Mark of the Unicorn."

Another striking fact about Atari's in-house equipment is how many laser printers are in use. A variety of different brands are on desktops and the laser units almost seem to have replaced dot-matrix and daisywheel printers at Atari. "We've found that two of the best buys in laser printers right now are the Quadram Quadlaser and the Canon LBP-82," says Harris.

"We use them in Epson or Diablo emulation mode."

At a rear corner of the downstairs floor is the Creative Services Department, where the various Atari manuals and package designs are developed. We are enthusiastically shown a powerful, new, enhanced version of the NEOchrome paint program for the ST.

## R&D UPSTAIRS

Atari's upper floor is the tour stop that will be of most interest to the majority of **Antic** readers. This is where Atari's engineers and programmers work on forthcoming products.

Coming up the rear stairs, the first thing we see is a prototype 3-piece computer. The keyboard is simply a mockup with individual ST keys stuck into a big sponge pad. The computer is in a separate closed box with a detached video monitor—the standard IBM-type arrangement. On top of the computer box is what seems to be a schematic diagram showing open slots for add-on boards.

"You need to understand that we experiment with a lot of prototypes up here that never make it to market for a variety of reasons," says Harris. "We won't talk about anything you might see on this floor unless Atari is reasonably committed to a release date for it."

Nearby are units that underline Neil's warning. One example is a rare PS3000, an ST color monitor with a built-in disk drive. About 1,000 of these experimental monitors actually were manufactured and sold through specialty computer retailers. We also see a prototype 1040ST with a 10-megabyte hard disk built in. Called the 1040STH, this version is not going to be released.

We move on to meet Atari's three-person final testing group. They use video recorders to keep track of exactly where new software crashes. The team is currently working on the Microsoft Write word processor. As we see it on the ST monochrome screen, the program looks fast and detailed, with a true WYSIWYG (what you see is what you get) graphic display. We are told that Write is a port

of Microsoft Word, in current Macintosh version 1.05, and it will support most popular laser and dot-matrix printers.

We see some of the new 8-bit products that are due in 1987. There's the SX212 Hayes-compatible 1200 baud modem which is to sell for \$99.95. We also see the sharp, clear text display of the XEP80 plug-in 80-column card (\$79.95).

As we walk by the equipment-crowded worktables, we see a lot of large, strange circuit boards featuring chips marked 68020. The Motorola 68020 chip is widely rumored to be the microprocessor for an upcoming Atari 32-bit computer which would support the Unix operating system.

Harris is more willing to talk about some of the other offbeat boards we see. Here is the original hand-assembled circuit board for the first prototype ST. "Unfortunately, a lot of the chips have been taken out for other projects," says Neil. "This board really should be left the way it was, as a piece of history."

Another curiosity is a cumbersome board that shows what ST circuitry would look like if it was designed on the same logic principles as the Macintosh. Atari engineers put it together as a joke. Patrick gets Harris to pose with the clumsy item. "Hurry up and take the picture," Neil says. "The whole bottom of this board is like a pincushion, you can't hold onto it without getting stuck."

Shiraz Shivji, Atari's Vice President of Research and Development, is having an impromptu hallway meeting. There's Landon Dyer, one of the programmers of TOS, and John Feagans, who is working on a new GEM version of the ST Writer word processor. We hear that the arcade hits Crystal Castle and Battle Zone are coming soon in ST versions.

When we ask about the hallway posters claiming that the Intel 820386 is a "stupid" chip, the technical staffers insist that the Motorola 68020 chip being worked with by Atari is faster and more powerful than the 386 which is going into the next generation of IBM-compatible computers.

It's a surprise to run into Dennis Friedman, who visited *Antic* several times while working for Atari in France. Dennis tells us he is based in Sunnyvale now and his current project is the second edition of the International ST Software Catalog. "It will be twice as big as the first edition," he says.

In a rear office we meet Jim Tittler, who is putting the finishing touches on the ST's IBM emulator box. As he discusses the complexities of IBM vs. ST disk formats, we learn that the box is to be an add-on to the DMA port. It will support the IBM 5 1/4 and 3 1/2 inch disks as well as the Atari 3 1/2 inch format. The estimate is that the emulator will run most MS-DOS software as fast as an IBM, in some cases faster.

Jack Tramiel's office is in a front corner. It's about the only office in the whole building that can be considered comparatively large. The room is currently empty, as the Chairman is looking after Atari business elsewhere in the world.

Down at the other end of the hall, Atari President Sam Tramiel has a full crew meeting in his office, including Richard Frick, Director of Fortune 500 and OEM sales; John Skruch, Associate Director for Computer Software; and Claude Nahum, General Manager of Atari in Spain. Tramiel is just passing through town during a short hiatus in a series of investor meetings preparing for the Atari stock offering. He mentions that Atari is recruiting programmers for the revived videocartridge machines, particularly the 2600.

## SOFTWARE VP

We learn that Leonard Tramiel, Vice President for Software, is now in charge of third-party as well as in-house software development. He has taken over from Executive Vice President Sig Hartmann, whose new assignment is to establish the ST with Fortune 1,000 companies and add-on value manufacturers as an affordable combination of high-powered workstation and mainframe terminal (with the VT100 emulator cartridge).

Leonard agrees to join us and an-

swer some questions. As we pass a fast-moving animated display utilizing the upcoming blitter chip, he explains that current ST owners will be able to obtain the blitter chip upgrade for about \$120. The upgrade will include a new set of TOS ROM chips.

Also coming soon is a new revision of ST BASIC from MetaComCo. The revised BASIC will feature additional commands and faster processing, along with direct control of AES, VDI, BIOS, XBIOS and GEMDOS. The same program will be able to run with or without the blitter chip.

We bring up an idea *Antic* had for a photo-essay showing every step in the manufacture and marketing of a single Atari computer. "Sorry, we couldn't allow any photographing inside the Taiwan assembly plant," Leonard responds. "Atari's facility is highly automated and our competitors would love to have a look at the robotics."

Patrick Bass asks about TOS error messages and gets a confirmation from Tramiel that error number 35 is a general error message which is given when the ST can't figure out anything more specific that's wrong.

## GDOS ARRIVES

Probably the most exciting new information Leonard tells us is that GDOS (Graphics Device Operating System) is now shipping to independent developers for use in new software. GDOS is already incorporated into DEGAS Elite. Software using the GDOS Normalized Device Coordinates will map its displays on an ultra-high-resolution grid of 32,767×32,767 pixels. This output will then automatically display or print out at the highest resolution available to whatever device the ST is connected to.

This makes GDOS a crucial tool for keeping the ST at the forefront of fields such as graphics and desktop publishing. As new video screens and laser printers with finer detail come to market, the ST's output will automatically adapt to the best quality that can be produced by these new devices.

# OOPS!

## I SHOULD A HAD A #/?\$! BACKUP.

How many times have you lost valuable data files because you skipped the tedious task of backing up your hard disk?

Now, you can have a "piece of mind" with Supra Corporation's streaming tape and backup software.

### *SupraStreamer* Tape Backup

Only \$799.

- 40MB STREAMING TAPE BACKUP
- 900KB/MINUTE BACKUP RATE
- USES STANDARD CARTRIDGE TAPES
- INCLUDES *SupraSure* HARD DISK BACKUP UTILITY

### *SupraSure* Hard Disk Backup Utility

Available Separately  
\$49.95

- WORKS WITH FLOPPY DISK OR STREAMING TAPE BACKUP
- 3-9 TIMES FASTER THAN USING TOS SYSTEM COPY
- INCREMENTAL BACKUP/RETRIEVE BY ANY COMBINATION OF THE FOLLOWING:
  - FILE TYPE
  - FILE DATE
  - TIME OF LAST FILE MODIFICATION
- IMAGE BACKUP
- ALLOWS BACKUP OF ANY SIZE FILE

This software is so fast and easy-to-use that you can be **SupraSure** that you will always have a current backup of your hard disk. **SupraSure** can backup data from your hard disk to the Supra Streamer tape backup system or floppy disk. You can do a complete backup of the entire hard disk (Image Backup) or selectively choose files by TYPE, DATE, TIME, or any combination of these. For example, you could do an incremental daily backup of new data files by simply selecting the current DATE and .DAT for the file type. SupraSure will then find all of the selected files and save them to tape or floppy disk. You can also restore files onto your hard disk selectively with combinations of these file identifiers. SupraSure also allows you to create a script to automatically select the files for each backup.

### *SupraDrive* Atari ST Hard Disk

20 MB SupraDrive \$ 799.  
30 MB SupraDrive \$ 995.  
60 MB SupraDrive \$1995.

Available at your local dealer, or call:

# Dvorak Keyboard

## *Turbo typing for Atari*

BY DAVID YEARKE

*Try out a version of the speed-typing Dvorak keyboard on any 8-bit Atari computer of any memory size, with disk or cassette. This BASIC program offers an alternative to the standard QWERTY keyboard—which was actually designed to slow down the pioneering generation of touch typists.*

**B**elieve it or not, part of your computer was designed to be as slow and inefficient as possible. No, don't blame Atari—the deed was done long before Nolan Bushnell or Jack Tramiel were even born. Confused? Here's a clue: it's the part of your Atari computer that was designed over 100 years ago—the keyboard!

The keyboard layout was invented by Christopher Sholes in the early 1870s for the Remington Arms Company, which produced the first typewriter. On the early mechanical typewriters, keys tended to jam when struck too rapidly. To overcome this, Sholes designed the QWERTY layout which is commonly used today throughout the world.

Sholes slowed down typists by making sure that the most commonly used letters were spread all over the keyboard, and that frequent combinations of letters, such as "ed," had to be struck with the same finger.

It may have been all right to slow down typists in Sholes' time, but today's electronic typewriters don't jam. So the reason behind the QWERTY system no longer applies. Fortunately, we have an alternative.

### DVORAK'S IDEA

In the 1930s, Professor August Dvorak studied the typewriter and concluded the Sholes layout was not only cumbersome, but that even a random arrangement of keys would be more efficient. He studied the keyboard and

people's typing habits, and devised a keyboard arrangement that gave what he felt was the best possible speed and efficiency.

Why is the Dvorak layout better? First of all, it involves less physical movement. He computed that a Sholes typist's fingers move an average of 16 miles a day, compared with a single mile for a typist using Dvorak. This improvement makes Dvorak not only less fatiguing, but faster as well. The average speed of a Sholes typist is about 40 words per minute (wpm), compared with 60 wpm for a Dvorak typist. This means that two Dvorak typists can do the work of three Sholes typists. How's that for efficiency?

Keyboard toggle switching between Dvorak and QWERTY are advertised for other computers and electronic typewriters that cost hundreds of dollars more than the 8-bit Atari. Here's a low-cost alternative, one that you can examine to see if you like this typing system. The Dvorak layout finally seems to be catching on, and your new-found skills as a Dvorak typist could come in handy.

NOTE: The Dvorak Keyboard pro-

gram has been used successfully with cartridge software such as AtariWriter, MAC/65 and BASIC (built-in BASIC too). It does *not* work with PaperClip or most other disk-based software. (Please send the I/O Board your own discoveries about software compatibility with this program.—ANTIC ED)

## DVORAK FOR ATARI

Figure 1 shows this modified Dvorak layout as implemented on the Atari. The top characters (black letters on white background) are the Dvorak Keyboard. The bottom characters (white letters on black background) are the standard QWERTY arrangement.

I didn't change the existing positions for the cursor keys and Atari special symbols. But I changed the position of some punctuation marks. For example, the slant bar [/] which Dvorak placed on the equal key [=] I've moved to the [Q] key. And I moved the quote character ["'] from the [Q] key back to the [2] key, as on the Atari's QWERTY layout.

I also opted for the "modified" Dvorak keyboard, in which the numbers are kept in sequence, as opposed to Dvorak's order of "7-5-3-1-9-0-2-4-6-8." I saw little advantage—and *lots* of confusion—in using his arrangement.

Notice that all the vowels and the most common consonants are located on the middle, or "home" row, where a typist's fingers are at rest. This is the key to Dvorak's speed. With the Sholes layout, only about 100 common English words can be formed using the home row, compared to over 4,000 words with Dvorak. Eliminating that half-inch that a finger must travel to hit a common letter really adds up.

Dvorak also made the workload of each hand more even. With the Sholes arrangement, the left hand works harder than the right, and left-handed typists are often faster than right-handed ones.

Finally, by putting the common letters on the home row, he has eliminated the phenomenon known as a "hurdle," where the same finger must

## AMAZING PRODUCTS

from

## Computer Software Services

Space is limited so we'll get to the point! Our product line has grown to 24 truly **AMAZING** products, each representing an outstanding value. Call or write for our **FREE** catalog today!

- 1. The "BLACK PATCH!"** Only \$49.95  
A disk only program that copies and **unprotects** hundreds of your heavily protected software programs. Many of these unprotected programs can now be converted to DOS executable files. Works with any **unmodified** disk drive!
- 2. The "ARCHIVER ENHANCEMENT!"** Only \$29.95  
A device that is installed into your Atari 810 or 1050 disk drive that greatly **enhances** the **copying capabilities** of your ARCHIVER or HAPPY ARCHIVER backup programs.
- 3. The "ULTRA SPEED!"** Only \$49.95  
An enhanced operating system for XL/XE owners that nearly **triples** the high speed read/write capabilities of 1050 disk drives having a KLONE, HAPPY BACKUP, DUPLICATOR, or U.S. Doubler! Numerous other built in features. Works with any DOS or unprotected software. **Fully automatic.** Instantly switchable between your original OS or our ULTRA SPEED OS! Works in single or **double density**.
- 4. The "KLONE!"** Only \$69.00  
Newly **improved** version now available! Installs into any Atari 1050 and provides the following enhancements: Allows **copying** of protected software, provides **hi-speed** read/write capabilities, transforms your 1050 into a **true DOUBLE DENSITY** drive plus much more!
- 5. The "RICHMANS 80 COLUMN Word Processor!"** Only \$59.95  
A very powerful **80 column** word processor that is easy to use **AND** gives you a **FULL 80 COLUMNS** on the screen with **NO** hardware modifications! Absolutely the finest available! Works with any TV or Monitor. Rat/Mouse enhanced. 52k RAM memory required.

The **FUZZY/PHANTOM** sector maker, The **MIRACLE**, The **DISKCRACKER**, The Impossible **ANALYZER**, THE **ULTRA MENU/DOS** plus 14 other innovative products... many at specially **reduced prices** in time for Christmas! **DEALER/DISTRIBUTOR/USER GROUP discounts** available!

Master Card - Visa phone orders.  
Money Orders - Check mail order.  
Specify computer and drive model numbers. Add \$4 shipping/handling (N.Y. State residents add 7% tax.)

# Page 6 Grab-Bag

*Punch up your program with these useful routines*

*Plug one of these short but powerful USR routines into your own BASIC programs to create a Joystick Enhancer or a Console Key Expander that operate at assembly language speed. You do not need to know assembly language to use the routines. The BASIC programs work on all 8-bit Atari computers of any memory size, with disk or cassette.*

**A**fter you are familiar with Atari BASIC, what next? Assembly language is the next logical step. Fortunately your Atari offers a bridge between these two languages—the USR (USer) function. This function lets the programmer call fast, powerful machine language routines from a BASIC program.

To smooth the transition between BASIC and assembly language even more, Atari also has a “protected” area of memory known as Page 6. Page 6 occupies 256 bytes of memory from location 1536 to 1791 (0600 to 06FF in hexadecimal). And it is left untouched by the operating system and BASIC.

During the coming months, **Antic** will be presenting a number of short but effective Page 6 utility routines which were originally released in 1982 by Synapse Software. You do *not*

Figure 1

need to know assembly language. Just type in these useful tools and make your programming sessions more productive.

## JOYSTICK EXPANDER

Our first routine, Joystick Expander, greatly reduces programming effort. It lets you use a simple ON . . . GOTO instruction to handle the different joystick directions.

When Joystick Expander is used in

your program, the values returned from a STICK(X) function will not be the standard ones. A centered joystick will return 0, forward returns a 1. (See *Figure 1*.) The values increase by one in a clockwise direction, with the forward/left combination returning 8.

To use Joystick Expander in your own program, type in Listing 1, JSTICK.LST, checking it with TYPO II. You do *not* need to type in Listing 2, JSTICK.M65, which is the assembly language source code (for MAC/65 or Atari Assembler/Editor) provided for the information of assembly language programmers. After you have an error-free copy of Listing 1, remove the TYPO II program and LIST JSTICK.LST to disk or cassette. Now, LOAD (or type in) your own program and then type ENTER

"D:JSTICK.LST". (Cassette owners substitute "C:" for "D:"). This will merge JSTICK.LST with your program.

Make sure that your own program does not have any lines numbered higher than 30000, or they will be replaced by the Joystick Expander. Somewhere near the beginning of your program include the line below. (Change the sample line number, if needed)

```
101 GOSUB 30000:JUNK=USR(1536)
```

The USR call only needs to be made once. Thereafter, any joystick readings will produce the new values.

## CONSOLE ENHANCER

This month's second routine is a useful Console Key Enhancer. With this routine in place, you will double the number of possible values that can be returned from your console keys—[OPTION], [SELECT] or [START]. Normally, a statement such as Y=PEEK(53279) would indicate which key was pressed.

Using the Console Key Enhancer, you can also detect the [SHIFT] key used in combination with the console keys. You can even “latch” these key values, so they are remembered after the keys are released.

Type in Listing 3, CONSOLE.LST, checking it with TYPO II. Follow the instructions about LISTing and EN-

continued on next page

## DVORAK KEYBOARD

continued from page 37

travel from the top row to the bottom (or vice-versa)—“hurdling” over the home row. There are over 1,200 common English words with multiple hurdles, such as the word “number,” where the first three characters are struck with the right index finger. Hurdles are a common cause of spelling errors, because fingers tend to get “lost” while hurdling.

## DVORAK DISCLAIMER

Despite the improved efficiency of the Dvorak Keyboard, it is not easy to switch to Dvorak typing if you are already accustomed to touch-typing with the QWERTY layout.

In fact, the difficulty of retraining typists who use the vast installed base of QWERTY keyboards is the main obstacle to widespread acceptance of the Dvorak layout. When your QWERTY-trained subconscious mind tells you to press an [F] key and you get a Dvorak [U], this can be a very disorienting experience—not unlike pressing the Coke button on a vending machine and receiving a handful of bubblegum.

To help preserve your sanity as you experiment with an Atari Dvorak Keyboard, you should photocopy *Figure 1*, cut apart the individual key guides and *lightly* glue them on top of your three rows of letter keys. (Or at least keep the diagram very close to your computer.)

Press [CONTROL] [4] to toggle back and forth between Dvorak and QWERTY typing. [CONTROL] [5] toggles one-key cursor movement on and off—in either Dvorak or QWERTY mode—allowing you to move the cursor without having to hold down [CONTROL]. To get the characters [-], [=], [+], and [\*] hold down the [CONTROL] key when pressing the appropriate key.

## HOW IT WORKS

The Dvorak Keyboard program replaces the built-in keyboard handler of any 8-bit Atari computer. In normal Atari keyboard use, whenever you press a key an interrupt is generated by the POKEY chip. The operating system looks to location \$0208 for the

location of the keyboard handler routine. This program replaces the handler in your computer, taking the code for the key you pressed and looking it up in a table to find the Dvorak equivalent.

Type in Listing 1, DVORAK.BAS, check it with TYPO II and SAVE a copy before you RUN it. Listing 1 will create a file called DVORAK.EXE on your disk. Antic Disk owners will find DVORAK.EXE on the Main Menu. Copy this file to another disk (which contains DOS 2.0 or 2.5) and rename it AUTORUN.SYS.

To start typing Dvorak-style, turn off your computer and reboot with the new disk. You won't notice anything different except that you have about 500 fewer bytes of available memory than before. Dvorak Keyboard continues working even after you press [RESET], so you'll need to turn off your computer to remove Dvorak from memory.

I removed the routine that processes function keys 1-4 on the 1200XL, which saved 105 bytes. Listing 2, the source code created with MAC/65, is included to show how the program works.

You will probably notice that in Dvorak or one-touch cursor modes the auto-repeat function is disabled. This is because the logic for that function is contained in the Vertical Blank routine and reads the hardware location directly, instead of the RAM shadow register, which is the one I changed. To avoid having this program larger than I wanted it to be, I opted to turn off the auto-repeat rather than rewrite the VBLANK routine. However, auto-repeat still works in normal mode.

*Dvorak typing implementations have long been a staple of Atari public domain software, but Antic liked David Yearke's clean programming and informative article when we saw it in POKEY, the newsletter of the Western New York Atari Users Group. So we asked Yearke, a resident of Cheektowaga, New York to expand his piece for this issue.*—ANTIC ED

Listing on page 89 

## PAGE 6 GRAB BAG

continued from page 39

TERing programs, which were explained above for the Joystick Expander routine. You do *not* need to type in Listing 4, CONSOLE.M65, the assembly language source code.

Add the following line to your own program, changing the line number if necessary. This routine only needs to be called once, unless you switch in or out of latch mode:

```
101 GOSUB 31000:
```

```
    BUTTON=USR(1536,CMD)
```

Note that we are passing a second parameter to the routine. The variable CMD can have one of three values—0 to turn OFF the enhancer, 1 to turn it ON, or 128 to turn on the enhancer and latch the last key pressed. Now, whenever you wish to read the console keys, do a PEEK(BUTTON) instead of a PEEK(53279).

Refer to the following table to see the values you may expect:

Normal	Enhanced
No press = 7	No press = 0
[START] = 6	[START] = 1
[SELECT] = 5	[SELECT] = 2
[OPTION] = 3	[OPTION] = 4
n/a	[SHIFT][START] = 9
n/a	[SHIFT][SELECT] = 10
n/a	[SHIFT][OPTION] = 12

## TECHNICAL NOTES

This article does not provide extensive technical explanations of the two routines, but the assembly source code is well documented and should provide interested readers sufficient information to understand how they work. These source programs can be assembled on either the Atari Assembler/Editor cartridge, or MAC/65 from Optimized Systems Software.

**IMPORTANT:** Because the Joystick Expander and the Console Key Enhancer run from the same part of Page 6, you should only use *one* of them in any program. For example, if you're using the joystick routine and decide to add any other routine which uses Page 6, the Joystick Expander will be over-written.

*Cousins Matt Loveless and Mike Eggers were both in their mid-teens when Page 6 was originally released on disk by Synapse Software in 1982.*

# GCP vs. CompuServe...

## the battle is on!

**NOW FOR  
THE ATARI ST  
RATES AS LOW AS  
\$2.95 HR**

**CompuServe**

**Here's what  
some leading  
reviewers say  
about GCP:**

**ANTIC:**

"Superb color graphics online"

**ANALOG magazine:**

"lends new meaning to the term 'user friendly' "

**NOVATARI user group:**

"If you're into gaming—even if you only play occasionally—GCP is great"

**ABLE user group:**

"experience a new dimension of competitive, interactive gaming"

GCP is **THE** online service for Atari users. We are the only online system that offers multiplayer games with full color graphics as well as email and downloads. Access is a local phone call from most U.S. cities. (call TYMNET at 800-336-0149 to find your local number)

GCP is an ATARI-ONLY service, so ALL our downloads (over 2 Megabytes!) are for Atari computers. Don't pay for information about other computers; stay where the excitement is: ATARI!

### And what are the games like?

Lords of Space is our premier space game, with hundreds of players competing in an unlimited galaxy with combat, production, alliances and economics; all controlled via your joystick and all using the full graphics potential of your Atari. Compare THAT with a screen of text!

CyberTank is a tactical game of tank combat played online against up to 15 opponents. Design your own tank in the secret labs and then slug it out with graphic realism on the scrolling battlefield. CyberShip is a naval variant of CyberTank, for the sea going gamer. BioWar is an abstract game for the intellectuals in the crowd.

### Compare and judge for yourself.

Perhaps you are considering subscribing to another online service. Compare GCP to CompuServe and then make your decision!

Check out the charts below and then call GCP at (717) 848-2660 (voice) to place your order!

PROGRAM BY CHARLES JACKSON

## Lesson 12: Graphic Modes

*This series teaches beginners how to program in BASIC on all Atari 8-bit computers such as the 800XL and 130XE. The lessons began in the March, 1986 issue.*

Computer graphics are great fun, and also an area where your Atari is really outstanding—even in comparison to more expensive machines. In this lesson, we will introduce the Atari's **graphics modes**, an essential subject for understanding how to create colorful visual displays.

Your Atari can display visual information onscreen in various different modes (ways). You get at least 12 different ways to show information in a simple **GRAPHICS** command, such as:

10 GRAPHICS X(where X is any whole number between 0 and 11)

### MEET THE MODES

Graphics Mode 0 (GR. 0) is the familiar blue screen seen when you turn on the computer. It displays 24 lines of 40 characters each. Two colors are normally displayed, the background color and the text color.

Graphics 1 (GR. 1) displays 24 lines of 20 characters that are twice as wide as those in GR. 0. This mode displays only capital letters, but it can display them in four different colors. Including the background color, you can normally put five colors on the screen at once in GR. 1. For a sample of text in GRAPHICS 1, type:

10 GRAPHICS 1:POSITION 1,1: PRINT #6; "HeLlO AnD wElCoMe"

Type GRAPHICS 0 and press [RETURN] to get back to the regular screen.

Graphics 2 is similar to GR. 1, but with 12 lines of 20 characters. Thus characters in GR. 2 are both twice as high and twice as wide as those in graphics mode 0. This mode is also capable of five colors. Try this:

10 GRAPHICS 2:POSITION 0,1:PRINT #6; "WeLcOme To #11"

### TEXT MODES

Graphics Modes 0, 1 and 2 are the text modes, where information is put on the screen as text. In Graphics Modes 3 through 11, information is entered as colored dots. The difference between these modes is the number of colors available and the **resolution**—how many dots will fit on the screen.

In general, as the graphics mode number increases, the resolution and/or number of available colors also increases. However, the memory requirement also increases. This table gives the requirements of the various GRAPHICS modes:

GR. Modes	No. of colors	Resolution (width × height)	Memory (Bytes)
Text			
0	2	40 × 24	992
1	5	20 × 24(-4)	672
2	5	20 × 12(-2)	420
Graphics			
3	4	40 × 24(-4)	432
4	2	80 × 48(-8)	696
5	4	80 × 48(-8)	1176
6	2	160 × 96(-16)	2184
7	4	160 × 96(-16)	4200
8	2	320 × 192(-32)	8138
9	16	80 × 192	8138
10	9	80 × 192	8138
11	16	80 × 192	8138

You can see the trade-offs among resolution, number

of colors and memory requirements. For example, GR. 4 has the same resolution as GR. 5 but needs only half the memory and can produce only half the colors. Modes 9 and 11 can produce 16 colors at once, yet they need the same amount of memory as GR. 8, which has only two colors. The trade-off is resolution. mode 8 can display 320 tiny dots across the screen, whereas GR. 9, 10 and 11 can only display 80 larger dots.

Graphics Modes 3, 5 and 7 each are capable of four colors—one background color and three “dot” colors. GR. 4 and 6 are capable of only two colors: the background color and one dot color.

In GR. 8, although two colors are possible, you have much less control over what they are. The dot color is the same as the background color, but with a different luminance (brightness). For example, if the background is black, the dot color could then be anything from white through shades of gray to black. Of course, if you make the dot color black, you’d be unable to see the dots against the black background.

Graphics 0 shares this limitation regarding to color selection. GR. 9 and 11 can display 16 colors at once, but again there are certain constraints on the colors you can select. GR. 9 lets you choose one color, and the others will be 16 shades of the color selected. GR. 11 lets you choose one luminance and can display all 16 colors in that selected shade. Finally, GR. 10 allows nine colors, which can be anything you like.

## VARIATIONS

When you ran the examples for GR. 1 and 2, you noticed that the top part of the screen was black, while the last few lines (equal to four lines of GR. 0 text) were still blue. This arrangement, with a large graphics section at the top of the screen and a small “text window” at the bottom is typical for GR. 1-8. To get rid of the text window and have an all-graphics screen, add 16 to the number you call in the GRAPHICS command. GRAPHICS 7+16 or GRAPHICS 23 produces GR. 7 with no text window:

```
10 GRAPHICS (7+16)
```

The screen heights listed in the table above are for the “no text window” case. If you want a text window, the available height of the screen is reduced by the number in parentheses. For example, in GR. 7 a text window reduces the available height of the screen from 96 to 80.

You’ll also notice that the screen is cleared when you use the GRAPHICS command. Normally this is what you want. I don’t think I’ve ever used the GRAPHICS command without wanting the screen cleared. But if you ever want the data left on the screen, just add 32 to the number in the GRAPHICS command. The following line delivers GR. 1 without the screen clear. GRAPHICS 33 also works:

```
10 GRAPHICS (1+32)
```

You may add *both* 16 and 32, so that you have no text window *and* the screen is not cleared. As long as there is a text window, the word **READY** will appear at the bottom of the window when a program finishes running. An advantage to this is that you can look at whatever you have

put in the upper part of the screen for as long as you like. If you do a GRAPHICS command without the text window, the screen automatically returns to the blue GR. 0 screen when the program is completed. To prevent this, you can add a line such as:

```
20 GOTO 20:REM endless loop, press [BREAK] to end the program and return to GR. 0.
```

## SCREEN POSITION

Since the *text* Graphics modes and the *graphics* Graphics modes are quite different, we will look at them separately. First we’ll cover the text modes.

Below, the PRINT #6; tells the Atari to put the text in the upper (normally black) part of the screen. If you just use PRINT, the text will be displayed in the text window. Try this:

```
10 GRAPHICS 1:PRINT #6;"THIS IS THE GRAPHICS PART";
```

```
20 PRINT "THIS IS THE TEXT WINDOW";
```

To specify where in the *upper part* of the screen you want the text, use the **POSITION** statement in the form: POSITION X-coordinate, Y-coordinate. Because computers count funny, the upper left corner of the screen is 0,0—not 1,1. So if the resolution of GR. 1 is given as 40×24, you can use any number between 0 and 39 for the X-coordinate and any number between 0 and 23 for the Y-coordinate. Going outside these ranges generates, naturally, a “cursor out of range” error.

The POSITION statement will not work to specify the position of the text in the *text window*. Instead you must POKE the X-coordinate into memory location 657 and the Y-coordinate into 656. The Y-coordinate is measured from the top of the *text window*, so the range of values for the Y-coordinate is 0 to 3:

```
10 GRAPHICS 1:POKE 657,3:POKE 656,1: PRINT "MOVE OVER IN THE TEXT WINDOW"
```

## FOUR-COLOR TEXT

Getting four colors for letters is easy, if not straightforward. Normally, only capital letters will print on the screen. If you use a PRINT #6 statement containing capitalized

# Wage/Hour Paymaster

*Here is our first published entry from the Antic 8-Bit Practical Program Contest—which is still open until June 15. Wage/Hour Paymaster is a short but useful program that keeps track of your hourly wage totals by week or by year. The BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.*

For the millions of wage-earners out there who are paid by the hour and put in overtime, Wage/Hour Paymaster calculates the weekly and yearly earnings from your total working hours. Short and simple as the program is, it has many convenient uses. For example, you could project how much cash that next overtime call will put into your pocket—and decide if the extra money is worth giving up your plans to attend the big ballgame.

To use Wage/Hour Paymaster, type in Listing 1, WAGES.BAS, check it with TYPO II and SAVE a copy before you RUN it.

When you RUN the program and see the first prompt, type in your hourly base pay. A pay rate of more than \$20

or less than zero is not accepted. Type in your name at the next prompt and then choose whether to send the program's output to the screen or to a printer.

Wage/Hour Paymaster then creates a five-column table showing your base pay, overtime pay, weekly wages and yearly wages—in half-hour steps ranging from 40 to 65 hours per week.

## PROGRAM TAKE-APART

Wage/Hour Paymaster is straightforward and well-remarked. The subroutines are near the beginning of the program to shorten access times. Each time a program tells your Atari to GOSUB a line, it searches for that line starting with the first line of your program. Placing often-used subroutines at the beginning of your program minimizes this search time.

The subroutine at lines 110-220 converts the program's output to dollars and cents format. Line 190 inserts the decimal point. If two trailing zeros are needed, the routine adds them at line 210. The resulting number is right-justified, so that the number column lines up on the decimal points.

Line 340 does a quick partial screen clear. The inverse up-arrow in the program is treated the same way as pressing [SHIFT] [DELETE]. This is one of the fastest and easiest ways to erase selected parts of your screen display.

Wage/Hour Paymaster is set up for Epson or Star (Gemini) printers. The printing routines automatically insert top and bottom margins, so you don't need to worry about printing your report on top of a page perforation.

# Multi-AUTORUN

*27 files at your fingertips*

BY BILL BODENSTEIN

*With Multi-AUTORUN you can automatically load as many as 27 binary AUTORUN files under DOS 2 or DOS 2.5. This BASIC program works on all 8-bit Atari computers of any memory size, with disk drive.*

I love writing utility programs, especially those requiring little time and effort to construct. Such was the case with this short BASIC program. But after I write a program, I tend to have a hard time explaining what it is good for.

It seems as if most machine language programs you find in the pages of *Antic* work only as AUTORUN.SYS files. But unfortunately, the commonly used Atari DOS 2.0 and 2.5 can only binary-load one AUTORUN file at start-up. Wouldn't it be nifty if you could make DOS load a *chain* of binary files when booting? If your answer is "yes," type in Listing 1, MULTIAUT.BAS, check it with TYPO II and SAVE a copy before you RUN it.

When you RUN the program, Multi-AUTORUN will ask you if you are sure you wish to modify your DOS. Type Y to continue, or N to abort. Next, insert your disk into drive 1 and press [RETURN]. This program writes information to your disk, so you should remove any write-protect tabs from your disk.

## IMPORTANT NOTES

*Don't* use Multi-AUTORUN directly on the Antic Monthly Disk. Instead, copy the DOS.SYS file (version 2.0 or 2.5) from any source to a new work disk.

Be Careful: Multi-AUTORUN will not work for *all* batches of AUTORUN files. For example, if one AUTORUN file is written to work with BASIC installed and a second file isn't, you will obviously run into trouble. Also make sure that you are not loading several AUTORUNs that want to occupy the same part of memory at the same time.

## HOW IT WORKS

Multi-AUTORUN inserts a machine language patch into the DOS routine that loads AUTORUN.SYS. Once modified, your new Atari DOS will binary-load AUTORUN.SYS, AUTORUN1.SYS, AUTORUN2.SYS, etc., *in succession*, up to AUTORUN9.SYS or until it receives a "file not found" error. That is, if no file named AUTORUN.SYS is found, DOS won't even check for AUTORUN1.SYS. Therefore, always name your start-up files in correct sequence to ensure proper loading.

The patch is only about 50 bytes long, so you won't lose much memory or much compatibility with machine language programs stored in low memory. In fact, you'll lose perhaps one sector on your disk with this modification.

By the way, once you've modified DOS, you can use the WRITE DOS FILES option from the DOS menu to modify other disks—you only need to run the BASIC program once.

## GET 27 AUTORUNS

You could also use the letters of the alphabet instead of numbers to get even more AUTORUN files.

Just start with an A in place of the 1 in AUTORUN1.SYS and you could have as many as 27 AUTORUN files on one disk. The program will load AUTORUN.SYS, AUTORUNA.SYS, AUTORUNB.SYS, and so on.

To try this version of the program, simply replace the 48 in lines 520 and 530 with a 64. Make sure to RUN this version of the program with an *unmodified* Atari DOS in memory.

I hope I've clearly explained what Multi-AUTORUN is good for, because I've just now thought of an idea for another short utility program...

*Bill Bodenstein, a computer science major at the University of Cincinnati, is a prolific machine language programmer, churning out utilities left and right.*

Listing on page 86

## NEW OWNERS COLUMN

continued from page 43

characters, they will appear in one color. Lower-case letters will appear in upper case, but in a *different* color. Two more colors can be obtained by using inverse-capital letters and inverse lower case letters:

```
10 GRAPHICS 1
20 PRINT "THE FIRST COLOR";
30 PRINT "the second color"
40 PRINT "THE THIRD COLOR":REM in inverse
50 PRINT "the fourth color":REM in inverse
```

You can get lower-case letters and certain symbols in GR. 1 and 2 by POKEing 756,226, which gives you four colors of the lower-case letters, but you can't have both capital letter and lower-case letters on the screen at the same time.

What about numbers and other characters? You can print an inverse number, but there's no such thing as a lower-case number. To get the other two colors for numbers, you need to print out different characters altogether. Like lower-case letters, certain characters don't appear on the GR. 1 and 2 screens the way you'd expect them to appear.

A full reference table showing these character substitutions would be too large to print here. In many cases, however, you can determine the proper ASCII value to use by taking the ASCII value of your original character and subtracting 32 (for color register 1), adding 96 (for color register 3) or adding 128 (for color register 2). Next month's New Owners Column will explain the Atari color commands in detail.

## THE LISTING

This month's listing, by **Antic** Technical Editor Charles Jackson, is a flashy visual demonstration showing what all the different Atari graphics modes look like. Type in Listing 1, NEWOWN12.BAS, check it with TYPO II and SAVE a copy to disk before you RUN it.

When RUN, the program begins its tour through the graphics modes with a simple Graphics 1 text screen. Press any key when you want to move along to a Graphics 2 text screen. Notice the flashing text window at the bottom of the screen.

Now you can press any key to switch over to the "dot" or "bit-mapped" graphics modes. Here, the program plots the course of a bouncing, rotating line. After each bouncing line is drawn, you may press the [START] key to draw another bouncing line, or press the [SELECT] key to move to the next graphics mode.

While the line is being plotted, the text window displays the number of the graphics mode you're seeing, the number of available columns and rows, the number of available colors and the number of the color currently being used. Since most of these demo screens include a text window, the number of available rows is decreased.

Graphics 9, 10 and 11 do not allow text windows, so you'll need to remember to press the [START] or [SELECT]

## WAGE/HOUR PAYMASTER

continued from page 45

Line 350 sends the printer a control code to print one line of expanded text. Line 370 calls for condensed print and line 650 lets you adjust the linefeed. If you own a printer that is not compatible with Epson or Star, check your printer manual for the substitute control codes, and insert them into these lines.

All calculation is performed in lines 760 to 830. If you wish to change your overtime pay rate from the straight time-and-a-half specified by the program, replace the 1.5 at line 800 with any other pay rate.

This short program can easily be modified to your own needs, if you know the essentials of BASIC programming. For example, a plumber—or other wage-earner who makes more than \$20 an hour—can increase the program's maximum base pay rate. (Hint: Don't forget to change the 20 in line 490.)

If you are a part-time worker who normally puts in less than 40 hours weekly, or a workaholic who toils more than 65 hours a week, you might want to change the program's minimum and maximum hours (Hint: One modification is the HRS=39.5 in line 1110.)

*Hal Boyer lives in Indianola, Mississippi. This is his first publication in Antic.*

IF YOU'D ENJOY SEEING MORE ARTICLES LIKE THIS ONE, CIRCLE 268 ON THE READER SERVICE CARD

Listing on page 90

keys after each "bounce." I've included a short beeping sound to let you know when a drawing is complete.

## PROGRAM TAKE-APART

Line 35: Defines four color values for graphics mode 10. Graphics 10 allows nine different colors, but only five of them may be defined with the SETCOLOR statement (which you'll learn about in the next lesson). The four remaining color values must be POKEd into memory.

Lines 70-90: These lines alternate the colors on our Graphics 1 screen, giving the effect of motion. This technique is often called "color rotation." Since we don't want to rotate our colors *too* fast, we slow down the process with a statement such as X=SIN(4). This statement uses your Atari's trigonometric functions, which take a (relatively) long time to compute.

Lines 120-140: This routine displays and removes the flashing text window in the Graphics 2 demo.

Lines 150-230: These lines tell the computer which graphics mode you want to use, along with the screen width, screen height and the number of available colors.

Lines 800-920: This is the subroutine which draws the bouncing line. Actually, the routine randomly creates two sine waves, one point at a time. Each time a pair of points is plotted, the program draws a line between them. The effect is a bouncing, rotating line capable of creating colorful patterns.

\$299

CIRCLE 255 ON READER SERVICE CARD

*Reviewed by Gregg Pearlman*

**Antic** has not been overly impressed with the Seikosha printers we reviewed in the past. But then the new U.S. management team from Hattori Seiko Computer Peripherals showed up at our offices as part of their nationwide tour spreading the message that the Seikosha product line had been thoroughly revamped.

We're glad we tried out the **Seikosha SP-1000A**. This is a full-featured, affordable, well-documented, Epson-compatible printer that delivers near letter quality and is probably the quietest dot-matrix we use around here.

It's still pretty slow—44 characters per second, as opposed to 51 for the Atari XMM801. (Reviewed in **Antic**, December 1986.) Near letter quality speed was only 13 characters per second. A 20,000-character text file printed with a simple 8-bit BASIC program was used for the speed tests.

On the up side, the trim and compact SP-1000A is easy to load, offering adjustable-width tractor feed as well as single-sheet paper feed. It can produce condensed and double-wide print.

The SP-1000A's Epson FX-80 emulation handles graphics with no problem. On the Atari 8-bits, the Seikosha did a fine job with Picture Plus and Broderbund's Print Shop. On the ST, there were no problems printing out DEGAS Elite pictures, although one of the printer's DIP switches had to be changed.

The SP-1000A's near letter quality printing can be accessed either from one of the panel buttons on the front

of the printer or via your software. (We tended to get better results using the panel button.) Other than that, the Seikosha's NLQ printing is comparable to what we got from the more expensive Star NL-10. (Reviewed in **Antic**, January 1987.) The SP-1000A will even give you near letter quality with elite type, which the NL-10 can't.

Graphics printouts on the SP-1000A are sharp and well-detailed—but not as dark as pictures we have obtained from other printers. Text printing was also on the light side. And it didn't help much to use brand-new ribbons or to move the print head closer to the paper (per instructions in the manual). Incidentally, our favorite replacement ribbon cartridge for the SP-1000A is presently the Radio Shack DMP-130 (\$10.95).

The printer's manual runs 103 pages and provides several illustrations and examples. The DIP switches on the back of the SP1000A are easily accessed and their functions are described thoroughly. Eleven international character sets can be called up via the DIP switches.

The Seikosha SP-1000A is a good all-around printer. For a low list price of \$299 (which will probably be widely discounted), you can sacrifice a little speed for good NLQ text and graphics printouts that are nice and sharp (although a bit light). If you're seeking a versatile, affordable dot-matrix printer, you can't go wrong with the SP-1000A.

(See the ST Resource cover on page 59 for an example of SP-1000A graphics printing.)

### KYAN PASCAL

Kyan Software  
1850 Union Street  
San Francisco, CA 94123  
(415) 626-2080  
\$69.95, 48K disk

CIRCLE 253 ON READER SERVICE CARD

*Reviewed by Sol Guber*

The new **Kyan Pascal** upgrade is up there with such top-notch programming environments as BASIC XL, ACTION!, Forth and MAC/65. This strong software development tool conforms to the ISO Pascal standard (level 0), so it's portable to mainframe computers. An enclosed series of toolkits makes it even more powerful.

The non-protected Pascal disk comes with both a compiler and an assembler. Assembly language code is produced in the final pass, allowing forward references to be resolved and

code to be generated very quickly. The assembler also lets the programmer insert assembly code into the source code.

Kyan Pascal uses 13-digit precision for numbers and is not slowed down by doing so. It also allows for the linking of source code modules at compile time for separate writing and debugging of programs.

This package comes with KIX, a new command-line file-management system. To write a program, you must enter the editor—which is good and fast. Once the program is written, it must be compiled.

Compiler options include debugging, generating source code, even watching the compilation progress. The compiler examines the whole program. Errors, while normally shown on the screen, can be sent either to disk or the printer.

The documentation is very good and has an excellent 150-page tutorial on Pascal. The disk contains sample reference programs. The tutorial begins by showing how a program is written, including the syntax and

continued on next page

## Product Reviews

structure of the commands needed to write a program. It then progresses to decision-making, looping, variables and procedures, and it includes information on records, sets, files and pointers.

Instead of P-code, Kyan Pascal produces native 6502 code. It changes the Pascal to assembly source code and then runs it through an assembler, which is available to the programmer as well as the compiler. The assembler has macros and allows for included files, and it's useful in time-critical applications to speed up portions of the coding. The examples in the manual are very clear, showing how to mix Pascal and assembly procedures.

The optional Kyan Pascal toolkits consist of **System Utilities** (\$49.95) and **Advanced Graphics** (\$49.95). The System Utilities are divided into I/O utilities, including those to access disk drives, keyboard, joysticks and paddles; system functions, which allow for changes in character sets, key clicks, [BREAK] keys and rebooting; screen management, which lets you place information anywhere on the screen and access all editor commands. Other routines include a random number generator, string-to-number conversion, and sort and merge routines.

The Advanced Graphics package provides routines for Player/Missile graphics, displaying high-resolution 3-D objects and using the Atari 1020 plotter. The 18 P/M procedures include setting up, generating shapes, movement and collision information. The seven plotter routines allow for the output of the 3-D graphics in color.

One limitation of the program is that Kyan has placed a licensing fee on use of the runtime library—which must be present on disk if you want someone to be able to run your Pascal application without having the Kyan package.

Kyan Pascal is a good, solid implementation that will help anyone learn to program in this useful lan-

guage. It will suit anyone needing the structure of a sophisticated, multi-featured Pascal.

CIRCLE 251 ON READER SERVICE CARD

*Reviewed by Gregg Pearlman*

Our 8-bit **Leader Board** golf game arrived a bit later than the fascinating ST version. But when **Antic** checked out the 8-bit package we discovered that it was good enough to almost make you forget about the ST game.

The main difference from the ST version is that the joystick-controlled 8-bit **Leader Board** doesn't present roughs, sand traps or trees. But its hazards are dangerous enough—everywhere you look, there's water.

In real golf, you'd be penalized one stroke and a replayed shot for each ball you put into the water, not to mention the added expense of more golf balls. And you must drop a ball on dry land no nearer the hole than the point at which the ball went into the water. **Leader Board** only adds a stroke to your score and lets you replay the shot. But because of all the water, those replays can add up fast.

A 15-page manual tells you all you need to know, and you'll get along fine, even if you don't golf. The manual explains which club to use when. You'll need this information whether

or not you actually play golf, because while your heart might tell you, for instance, to use your pitching wedge 100 yards from the hole, the manual says not to use it beyond 83 yards.

**Leader Board's** three ability levels, Novice, Amateur and Professional, are progressively tougher *and* more realistic. Novice players will hit the ball in the direction they aim—they don't have to worry about hooking or slicing. But Amateur players must rely on their reflexes in order not to hook or slice. So do Professionals, but they have the added concern of wind factors affecting their play.

It only took a short while to get the hang of **Leader Board**. I prudently played my first few rounds at the Novice level, topping out at an 18-hole score of 64 (on a par 72 course). I thought that was a fairly awesome round of golf, so I tried the Professional level. I shot an 80 (including five tee shots into the water—on one hole), which still isn't bad, but 80 won't win the big tournaments.

Your golf bag contains three woods, nine irons, a pitching wedge and a putter. Each club is given a minimum and maximum strike distance as a guide. The game doesn't acknowledge the possibility of hitting a ball farther with some irons than with some woods. Nor does it take into account the fact that *in theory* you're far more likely to hit the ball straight with an iron than with a wood.

**Leader Board's** ST graphics feature outstanding detail and quick updating. But the graphics are top-class on the 8-bit also. The detail isn't as sharp, of course, but the screen quickly updates its first-person picture of the course. In this game, however (and indeed in most 3-D games, it seems), the player's perspective is a bit odd. You can't really tell how far away the hole is. Luckily Access has provided diagrams of the four built-in courses, so at least you'll know where to hit the ball in order to avoid the water.

Like real golf, success with **Leader Board** is a matter of timing. You must know exactly when to press the joy-

## Product Reviews

stick button for maximum distance and straight shooting. It takes practice. That's why *Leader Board* provides a driving range, which lets you see on-screen how far each club can hit the ball.

One nice thing about *Leader Board* is that you can copy a backup disk without any trouble. However, you'll need the supplied hardware key in joystick port 2 for the game to work.

*Leader Board* is a fun game whether or not you actually play golf. Its graphics are a wonder to see, and play is, for the most part, realistic. The only thing wrong with *Leader Board* is that it might keep you indoors, playing golf from your armchair, instead of outside in the fresh air.

### VESTOR

Investment Technologies

(201) 494-1200—New Jersey

\$295, requires modem

CIRCLE 258 ON READER SERVICE CARD

*Reviewed by Edward Beddow*

**Vestor** is a 24-hour online investment database offering over 30 "technical trading" programs for buy/sell signals, screens, fundamental and technical rankings, etc. According to Investment Technologies, a model portfolio using the buy/sell signals generated from this system from 1964 to 1984 beat the market averages by over 20 percent per year. Of course, as with any investment service, future results cannot be guaranteed.

Your **Vestor** package comes with only a manual and a password. To access this mainframe-based service, your computer needs a modem and communications software. The one-time fee of \$295 and a minimum \$24 monthly fee are automatically billed to your credit card. Monthly charges are based on actual usage and also depend on the types of reports requested. In addition, local access via

Telenet carries charges for connect time. However, brokerage clients of Charles Schwab & Co. can get a \$100 rebate on the up-front fee.

The **Vestor** main menu choices are stocks, options, futures, averages and information/retrieval. Each of these gives you several reporting or screening selections accessed by a two-character code, with output format either in standard tabular report or bar-chart. The stocks section has technical statistics on about 4,500 securities as well as a graphic presentation of share price and the ability to screen the database for numerous technical factors.

The options section is much like the stocks area. The program does not access or chart option prices, but instead gives the share prices of optionable stocks and a "what if?" analysis for various price movements. The futures and averages modules provide similar data on selected commodities and the major market indexes.

The heart of the **Vestor** system is its buy/sell signals generated by proprietary equations. The stock evaluation section is the most commonly used module, providing technical indicators that show the comparative attractiveness of a security. The relative strength of a buy or sell signal is indicated. And at the bottom of the chart, the estimated profit is calculated as a self-test of the buy/sell algorithm.

The handy information/retrieval module provides not only historical price information but also lets you track securities, holdings and profit/loss in several individual portfolios. You can request ticker symbols for unfamiliar securities. Online help is available and you can send messages directly to the sysop.

The manual is easy to understand and has sound information on developing an investment strategy based on personal goals. Risk, leverage, diversification and discipline in making decisions is stressed in several parts of the manual. **Vestor** is easy to use because all selections are made from menus. I liked being able to save

several lists of common stocks for evaluation and charting, eliminating the tedium of typing in ticker symbols each time the program is used. The portfolio management system, though really just a simple spreadsheet, is a nice, useful extra.

Reports and charts both take too long to receive; they don't scroll across the screen like the text sent from the originating system. Also, the charts are not high-resolution graphics, but rather are made up of = and x symbols to create a sort of bar chart which can be difficult to read.

This is definitely a technical trading program. In other words, it will appeal to investors who make decisions based on arcane statistical trends. **Vestor's** buy/sell advice is generated by proprietary formulas, the makeup of which are not disclosed to users. While the publisher often mentions **Vestor's** inclusion of fundamental analysis, I found very little fundamental research information on which investment decisions could be based.

I question the program's statistical information. For example, some earnings-per-share numbers were out of date. Users may be making decisions based on non-current data. I also found that **Vestor's** industry codes for many companies didn't accurately describe the business of the company being evaluated.

What this package provides is access to a proprietary trend line and buy/sell signals which seem to change with great frequency. Adhering to all the buy/sell signals would require a great deal of trading and the payment of associated brokerage commissions. In any case, you must establish personal trading rules by which to employ the signals provided by the program.

The publisher does not provide a reference booklet listing the securities included in the database, but almost all common stocks on the New York and American exchanges and 1,500 of the more active OTC issues are included.

# New Products

## EASYFIND SYSTEM

(magazine index)

Sierra Services

P.O. Box 40454

Bellevue, WA 98004

(206) 881-2868

\$9.95, 48K disk

This specialized information retrieval software works with indexes compiled from articles in **Antic** and other computer magazines. Each one-year index contains a summary of every program, article, review, correction and tip—all cross-referenced. The **EasyFind System** uses multiple search phrases or keywords to quickly retrieve these references, outputting them to screen, disk or printer. Each full year of information costs \$4.95 per magazine.

## VIDEO VEGAS

(entertainment software)

Baudville

1001 Medical Park Drive S.E.

Grand Rapids, MI 49506

(616) 957-3036

\$29.95, 48K disk

Turn your Atari into a casino with **Video Vegas**. Play the slots, blackjack, draw poker and keno. The **Lucky 7** slot machine is a classic three-reel slot which pays back about \$98 for each

\$100 you put in. **Blackjack** features a sort of card-counting tutorial to sharpen your skill. **Draw Poker** mimics video poker machines, paying off on a pair of jacks or better. **Keno** is just like real Keno—except there's no real money to lose.

CIRCLE 257 ON READER SERVICE CARD

## MATH BLASTER!, WORD ATTACK!, SPELL IT!

(education software)

Davidson & Associates Inc.

3135 Kashiwa Street

Torrance, CA 90505

(800) 556-6141—National

(213) 534-4070—California

\$49.95 each, 48K disk

These three programs help students master math, vocabulary and spelling in a new, exciting way. **Math Blaster!**, for grades 1 through 6, contains more than 600 problems grouped into 25 "families of facts" in ascending difficulty levels covering addition, subtraction, multiplication, division, fractions, decimals and percents. **Word Attack!** gives 4th-graders through 12th-graders 675 new words in 27 lists and various tests. Additional data disks are available for \$19.95. **Spell It!** has 50 word lists covering 1,000 commonly misspelled words in five difficulty levels featuring games and an editor.

CIRCLE 258 ON READER SERVICE CARD

## GUDERIAN, STOCKS AND BONDS

(entertainment software)

Avalon Hill

4517 Harford Road

Baltimore, MD 21214

(301) 254-9200

48K disk

**Guderian** (\$30) uses the popular joystick-driven system from the **Gulf Strike** game to simulate this World War II campaign. The player must master Blitzkrieg tactics to encircle and overrun Soviet divisions and drive deep enough into Russia to capture Moscow. **Stocks and Bonds** (\$25) puts you into a different kind of battle. In a fast-

paced format, you invest in securities and get a graphic understanding of the Bull and Bear markets along with the importance of performance histories in planning an investment strategy.

CIRCLE 260 ON READER SERVICE CARD

## KEYPUNCH SOFTWARE

(various programs)

Keypunch Software

1221 Pioneer Building

St. Paul, MN 55101

(612) 292-1490

\$6.99 to \$9.99, 48K disk

The extremely low prices are the kicker in this new family of 8-bit software. Entertainment software includes **Gambler**, **Space Games**, **Arcade Games**, **Strategy Simulations** and **Mind Mazes**. Others include **Money Tools**, **Fun in Learning** and **Fun in Numbers**.

CIRCLE 264 ON READER SERVICE CARD

## WARSHIP

(entertainment software)

Strategic Simulations Inc.

1046 N. Rengstorff Avenue

Mountain View, CA 94043

(415) 964-1353

\$59.95, 48K disk

Almost every warship that fought in the Pacific from 1941-45 is included in **Warship**. Choose from 79 classes of ships from the Allied or Japanese fleets, or modify ship data to create new warships. The game has four scenarios—including one non-historical situation. Players can also devise original maps to create any possible ship-to-ship tactical surface engagement.

# ATARI® 8-BIT POWER

ALPHA SYSTEMS is constantly innovating to provide more power for your 8-bit Ataris.

**Y**ou don't need an ST to run high-powered software. Your Atari 400, 800, 800XL, 1200XL or 130XE can compute circles around others with these quality packages. — Don't let our low prices fool you — Super Quality doesn't have to be over priced.

**DIGITIZE YOUR WORLD** Now you can connect your Atari to a wide range of external interfaces that you can build. This how-to book (over 150 pages) includes all the instructions needed to build a light pen, household appliance controllers, alarm systems, light and motion detectors, voice recognition, and much, much more. The book **Your Atari Comes Alive** includes detailed schematics and instructions for each device. The disk includes the BASIC and Assembler programs to run them. Create your own exciting devices and save money!

**Your Atari Comes Alive** — Introductory Price **\$24.95**

## DIGITIZING POWER

**PARROT** The hardware & software you need to digitize real world sounds and play them on your computer. Make your Atari speak in your own voice record and play sounds from a complete orchestra. Play the digitized instruments and sounds from your keyboard, or put them in your own BASIC programs. PARROT is now being used for special effects by professional musicians. Turn your Atari into a digital sound sampler and keyboard. Everything you need to record and play digital sounds **\$39.95**

Additional pre-recorded sound tracks **\$4.95**/with purchase of PARROT.

## COMPUTEREYES™

Feed the pictures from your video camera or VCR into your computer and save the images as a graphics screen. Put your picture in your own programs, or digitize your favorite movie star. Our COMPUTEREYES and MAGNIPRINT II+ combination special lets you print your pictures in 16 shades of grey with incredible detail. Combine the features of MAGNIPRINT II+ and COMPUTEREYES for digitizing power that can't be beat. Koala Pad, Touch Tablet compatible.

**COMPUTEREYES and MAGNIPRINT II+ \$119.95**  
**COMPUTEREYES only \$99.95**  
**COMPUTEREYES, B/W VIDEO CAMERA, MAGNIPRINT II+, and CABLE \$329.95**  
**GRAPHICS 9 CAPTURE SOFTWARE \$12.00**

## MAGNIPRINT II+

Easily the most powerful and versatile printer package available. Accepts screens from Koala Pad, Print Shop, RAMbrant, MicroPainter, SynGraph, Touch Tablet, Typesetter, Graphics Master, many, many others. Prints in literally hundreds of sizes, shapes, shades, and distortions, including 6 ft. poster printing. Create detail and resolution thought impossible on a standard dot matrix printer. Supports 16 shades of grey and even color printing (you need color ribbons or color carbons for that). Touch-Up your pictures with multi-size and multi-font text. Works on STAR, Gemini, Panasonic, CITOH, NEC, EPSON or compatible printers. (850 interface or equivalent required).

**Incredibly priced for only \$24.95**

Free BONUS with every MAGNIPRINT II+ — PRINTALL prints your programs and files with all Atari inverse and graphics characters.

**GRAPHICS TRANSFORMER** Create Print Shop icons from your favorite drawing program, a ComputerEyes digitized photo, or saved picture files. Create, Merge, Shrink, or Enlarge to transform your graphics from one to another. Transfer pictures between programs to use the features you need.

**ONLY \$22.95**

## IMPERSONATOR

Cartridge to Disk copy system. Create running backups of any cartridge (up to 16K) on Disk. **ONLY \$29.95**

## THE Sc analyzer

Extract the programming secrets for any Atari program. Sc analyzer easily breaks through protection to let you list and study programs. Works with programs on Disk or Cartridge, finds hidden directories, detects copy protection methods and more. **ONLY \$29.95**

**PROTECT YOUR PROGRAMS AUTOMATICALLY COPY PROTECTION METHODS EXPOSED**

Now the state of the art secrets of software copy protection, piracy, phone phreaking, and hacking are revealed. These comprehensive book and disk packages take you from a novice to an expert in this fast changing field. Everything you need to understand complex protection, and create your own custom methods. Topics include, Unstable Sectors (Phantom or Fuzzy Sectors), Forced CRC Errors, Overfilled Tracks, Short Sectoring, Hardware Data Keys, Cartridge Protection, Cassette Protection, Crackdown on Pirates, New Laws Dealing with Piracy, Hacking, On-Line Security, Phone Phreaking, Building Black Boxes, Pirate Bulletin Boards Systems, Trojan Horse Programs, Logic Bombs, Self-Destructing programs, much, much more.

The disks included with these books contain powerful utilities to let you automatically protect your files. Features include:

- Automatic directory hiding
- Data encryption (stops pirates from changing your copyrights, etc.)
- Limited use option (makes the program self destruct after a limited number of runs)
- Password option (requires an 8 byte password before the program will run)
- Disk Protection check (have your program check disk protection before running)

Use these methods and more automatically, with no programming skills needed.

**BOOK I and DISK I \$24.95**

**BOOK II (Advanced protection) and DISK II \$24.95**

**Special limited time offer — BOTH SETS for \$39.95**

BY GREGG PEARLMAN, ANTIC JUNIOR EDITOR

# TACE

*Serving 500 square miles of Texas*

**T**ACE, the Temple Area Computer Enthusiasts, is located right in the middle of Texas. "I'd say we cover about 500 square miles," says TACE founder Jim Wesolowski, "but we also have members in other states and even in Germany. There's a lot of military around here, 285,000 troops in the area. Fort Hood itself is 323 square miles. Temple, on the other hand, has 42 people and is six miles from one end to the other." Temple residents used to go about 65 miles for the nearest Atari equipment, but a new full-fledged dealer has cropped up less than 40 miles away.

Wesolowski, confined to a wheelchair as a result of a tunnel explosion while serving in Vietnam, is now TACE librarian and system operator of the users group bulletin board, the Telephone Company. "I also belong to SAM, the Sysops' Association of the Metroplex," Wesolowski says. The Metroplex is the triangle between Waco, Temple and Killeen, including Fort Hood and Harbor Heights. "To give you an idea of how big the area is, one sysop drives 163 miles each way for our monthly meeting."

TACE officially meets at Wesolowski's home three times a month—some people drive over 100 miles round trip. But members stop

by all the time. "It's an oddball arrangement," says Wesolowski. "I'm stuck at home all the time. So when people come for disk swaps or to learn something on the computer, 10 might show up on Saturday, 15 on Sunday—or whenever they can make it. They'll come any day of the week to learn whatever was taught at the last meeting."

Most TACE members are in the military, so the largest age group is be-

tween 18 and 34. However, TACE memberships cover an entire family, not just an individual. Including children, the total membership is about 400—of which some 103 families are primarily Atari users.

"I have non-Atari users over also," says Wesolowski, "though my only computer now is an ST. For instance, I worked with a couple of IBM users on C compilers." The A in TACE used

continued on next page

to stand for Atari, but the group now includes users of other personal computer brands. Previously there had been no groups for non-Atari users in the area.

TACE holds a major meeting every three months at Kwik-Fix Electronics, the only full-service Atari dealer in the area. Average attendance is around 160. TACE membership has grown about 22 percent a year since it began in 1983.

## TACE BBS

The Telephone Company bulletin board runs on Wesolowski's one-megabyte 520ST, with a 20Mb Atari hard disk and Michtron BBS software (rev. 2.0). The BBS is online from 5 p.m. to 10 a.m. on weekdays, 24 hours on weekends and holidays.

"We have about 8Mb of MIDI music and graphics online—they're the major push," says Wesolowski. "We have 1Mb—108 titles—of Activision Music Studio files and 3.5 megs of Hybrid Arts EZ Track MIDI songs. In fact, Hybrid Arts' own BBS doesn't even have half a megabyte—they call mine to get more music. We also have 2Mb of DEGAS and NEOchrome pictures."

The Music Studio material ranges from "The William Tell Overture" to "Rhapsody in Blue" to Broadway showtunes and the "Hooked on Classics" series. All music and graphics files on this BBS have been compressed as much as possible with ARC (short for Archiver) public domain software found in such online services as GENie and CompuServe. ARC compresses 330,000 bytes of Hybrid Arts programs to 64,000, and it crunches NEOchrome pictures from 32,000 bytes to 5,000.

"Forty-five percent of our callers are long distance—I even have callers from Ohio and California," says Wesolowski. The Telephone Company BBS is open to everyone. First-time callers have upload and download capability. Online time is limited to 35 minutes until users are validated and get boosted to 75 minutes.

TACE actually has five bulletin boards covering topics from computers to country-western music. Wesolowski's system just handles the

Atari information—8-bit and ST. All the TACE systems run at 300 and 1200 baud. "Because the of the range of topics," says Wesolowski, "people usually call one BBS, then another and another. They don't usually hook up to just one."

Wesolowski updates TACE's online newsletter monthly. "We've channeled our energy into software reviews," he says, "and I've got online reviews of Haba, Michtron and Activision products. I'm limited to how much I can do at a time, though, because I have only one ST."

Antic first heard about the Telephone Company when it used to spe-

---

*Because TACE

all the time*

---

cialize in listing phone numbers for other bulletin boards throughout the country. This specialty was discontinued when it became too difficult to keep up with the constant changes in a list of 1,400 numbers.

## TACE ACTIVITIES

TACE's president, Paul Fische, is the Chief of Recreation and Rehabilitation at a nearby Temple Veteran's Administration Medical Center and TACE is one of the few Atari users groups in the United States with the VA as a member.

"We help the VA hospital with 8-bit computers," says Wesolowski, "which they use in a nursing home for recreation and rehabilitation in

terms of such things as hand-eye coordination after strokes. We also work with the Muscular Dystrophy Association and have a hotline modem pledge system for the Jerry Lewis Telethon."

Another group member is Temple Junior College, which holds an annual continuing education class that covers various computers and modem operation. TACE is also a charter member of the Worldwide User Network and has started a bulletin board association against piracy.

## TACE SURVEY

TACE supplied the following survey information. Of the 103 Atari-owner family memberships in TACE, 9.8 percent use STs and the remainder use 8-bit computers in this order: 800XL, 800, 130XE, 65XE and 1200XL. Atari 1050 and Indus GT disk drives are the most popular.

The most widely-used modems are the Avatex, Volksmodem, Atari, Supra (MPP) and Hayes. Twelve percent of the members use online services, primarily GENie, CompuServe and Dow Jones.

About 6 percent of the TACE Atari-ians are active programmers, while another 12 percent program occasionally. Rankings for the favorite 8-bit languages are Atari BASIC, Microsoft BASIC and ACTION!. ST programmers favor C, ST BASIC and assembler, in that order.

The software types used most by members are ranked here in order of importance:

1. Business/Financial
2. Word Processing
3. Programming
4. Help for Handicapped
5. Education
6. Communications
7. Games
8. Robotics
9. Artificial Intelligence

# When Printers Get Down to Business

## They Get With the **XLEnt** PRINTWARE SERIES

The **8-Bit Atari** software that will really give the business to your Epson, Panasonic, Prowriter, Gemini, NEC, SG, Citizen or compatible printers.

### **Typesetter \$34.95** By Dorfman & Young \*

Get design freedom to create letterhead, posters, title pages, and more. Use the joystick or keyboard driven sketch pad to create and place clip art, logos and graphics anywhere on a page. Loads graphic, 7 + /8 and Printware Series files and lets you control your printer, practically down to every dot on the page! Produce results that look almost professionally typeset. 48K/128K disk

### **MegaFont II+ \$24.95** By Dellinger & Rognlie \*

A complete program lister and graphics dumper. This utility is used by most national Atari magazines to print out program listings for publication; but it's much more. Print graphics, 7 + /8 and Koala screens, and Printware Series files in multiple sizes. Type direct from the keyboard to the printer in your own custom of output. Design custom Print Shop™ fonts and graphics with the P.S. Interface drawing program. 48K disk

### **P.S. Interface \$29.95** By Castell \*

A value-added Print Shop™ interface utility that raises graphic output to new levels of clarity and compatibility. Integrate Typesetter icons with Print Shop™ fonts and graphics. Convert Print Shop™ fonts to Typesetter icons and select from four sizes of output. Design custom Print Shop™ fonts and graphics with the P.S. Interface drawing program. 48K disk

Print Shop™ is a trademark of the Broderbund Company

### **Page Designer \$29.95** By Dorfman & Young

A layout utility that lets you plan an 8½" × 11" page on your screen and then print it. Mix text, graphics and Typesetter fonts for fantastic two-column newsletters. Two text modes; 40 column allows any Atari character set, 80 column puts twice as much information on the same page. Page Designer works with other Printware Series software. 48K disk

### **Rubber Stamp \$29.95** By Dorfman, Young & Dellinger \*

A collection of XLEnt creative utilities that let you build a library of high resolution icons, including converted Print Shop™ icons. Create up to four icons at once, and use the only 16 × 16 character set and text editors available for your Atari. Control the height and width of characters to get 32 different character sizes. Print up to 99 graphic labels with the special label printer. 48K disk

### **1st XLEnt Word Processor \$29.95** By Castell

A fully featured, friendly and fast word processor. 1st XLEnt Word Processor uses a joystick and icon interface, has toggle between full-screen windows, and a very readable 80-column print preview to see what your document will look like. According to Antic Magazine's January '87 review, 1st Word is, "As good or better than any other word processor you'll find for the 8-bit Atari". 48K disk

# USING INP AND OUT

## Create a terminal program in ST BASIC

by ALEX GOLITSIS

**T**here are two mysterious commands in ST BASIC that are perhaps the most powerful, but least known. They allow you to print text to your printer, or even communicate with other computers. The commands are INP(x) and OUT x,y.

For communicating with the outside world, nothing beats this pair. INP is short for INPut, and OUT, of course, is short for OUTput. These are the two basic, primary functions that a computer performs. It inputs to gain information, and it outputs to send information.

Chart 1 shows the values that x can be in INP(x) or OUT x,y. You would probably guess from the chart that 4 takes input from your ST's keyboard, right? Wrong. The console (2) takes care of both screen output and keyboard input. The "keyboard" refers to the virtual keyboard, not the physical one that you type on.

Have you ever wanted a screen to wait for the user to hit a key before continuing? Well, INP is one way to accomplish this. Since you want the user to hit a key on the keyboard, we use assignment number 2 (console). To check the status of the character buffer for any of the devices, use its negative. It will return zero if there is no character, or -1 if there is a character waiting in the buffer.

So to check if someone has hit a key, you would say:  
1000 IF INP(-2)<>1 THEN 1000

This should keep BASIC busy until someone hits a key. Unfortunately, though, there is a hitch. GEM's "Desktop" interaction, consisting of the mouse pointer and key buffering, steals almost all of the characters before line 1000 can get to them. All is not lost, though. It is as easy as turning GEM's "Desktop" interaction OFF with the following command:

```
POKE SYSTAB+24,1
```

And to turn it back on,

```
POKE SYSTAB+24,0
```

So, we can now use our original line in a subroutine at the end of your program. We can label it "KEYIN". Here's how it looks:

```
KEYIN:
```

```
POKE SYSTAB+24,1
```

```
A=0  
WHILE A<>1  
A=INP(-2)  
WEND  
POKE SYSTAB+24,0  
RETURN
```

This subroutine can now be called with a GOSUB KEYIN any time you would like the user to hit a key to continue in your program.

Now that you have the basics of INP, I can introduce you to its sister, OUT. OUT does the opposite of what INP just did. Instead of taking in a character, OUT sends out a character to any of the devices in Chart 1. The format is identical, but you cannot check the status through OUT because it is up to the program to supply the characters this time. Let's send the characters "HI" to your printer.

```
OUT 0,72  
OUT 0,73  
OUT 0,13
```

For those of you who haven't memorized the ASCII values for every character, 72 is decimal for "H" and 73 for "I". 13 is a carriage return, inserted because many printers with buffers won't print until they receive one.

At this point, you may be asking, "Hmm . . . What would happen if I sent a character to the screen through OUT? Will it show up in the OUTPUT window?" Hmm indeed. Let's try it.

```
OUT 2,72  
OUT 2,73
```

(Notice we don't need the carriage return this time.)

What happened? Instead of looking through all of the windows for "HI", focus your attention to the top left corner. After Debug on the menu bar, the letters HI have appeared!

By now, some of the implications of these commands might be running through your head. "If I can get two characters on the screen, I must be able to fill the whole screen with my own text". You can, if you do it carefully.

continued on next page

One of the assignments we haven't used yet is number one, the RS-232 port. This is where your modem plugs in. If a little lightbulb just lit up above your head, you're not alone. Now that we can control incoming and outgoing text to the modem, who is going to stop us from writing an ST BASIC terminal program? Or even a Bulletin Board System (BBS)? The answer is no one.

Before we go on, first realize that the all-text part of the ST's operating system uses the VT52 standard terminal. If you have studied the table of escape sequences for the VT52 that have been published in some books, you might have noticed some very exciting features. But if you recall, the screen isn't cleared by an ASCII 12 like most terminals, but rather an [ESCAPE] (ASCII 27) followed by the capital letter E (ASCII 69). Since OUT 2 utilizes VT52 codes, sending these characters through OUT 2 should clear the whole ST BASIC screen. If you try it, you will definitely agree that it does. Windows, drop-down menus and even the grey background have all disappeared. But if you have just entered these lines in COMMAND mode, you will notice that moving the mouse, hitting keys, and dropping menus seems to have a rebuilding effect. You cannot, unfortunately, have the ST BASIC Desktop back in perfect condition without re-booting. You will also notice that the characters you now type are not appearing at the top of the screen with our "HI", but rather back in the COMMAND window.

With this knowledge, we should be able to make a short program that echoes every character you type to the blanked-out screen (and not the OUTPUT or COMMAND windows). The following program will do just that:

```
1000 ON ERROR GOTO 5000
1010 POKE SYSTAB+24,1
1020 OUT 2,27:OUT 2,69
1030 CHAR.IN=0
1040 WHILE CHAR.IN<>13
1050 A=0
1060 WHILE A<>1
1070 A=INP(-2)
1080 WEND
1090 CHAR.IN=INP(2)
1100 OUT 2,CHAR.IN
1110 WEND
5000 POKE SYSTAB+24,0
5010 END
```

What you type will be shown on the first line of the screen (normally the menu bar) and will continue along until you hit [RETURN].

The ON ERROR GOTO 5000 is included just in case you make a typing error. All errors are fatal unless you trap them because with GEM's interaction turned off, you have no way of talking to ST BASIC, which is a GEM application. If we hadn't included the ON ERROR GOTO and we had made a mistake typing, we would have had to reset the ST.

With this small program, we can send a line of text to the screen, the printer, or even the MIDI port. Or we could

have sent it to the modem.

The modem works just like the keyboard. If a character has come through, a -1 will be returned from INP(-1). If no characters are available, a zero will be returned. OUT also works the same with the modem. If you would like to send a character to the modem, OUT 1,(ASCII VALUE) will do it. With this information, we could go about writing a very short terminal program in ST BASIC that, for starters, will be very similar to the VT52 Desk Accessory. But there is one major difference: you cannot customize the VT52 desk accessory.

The main escape codes are listed in Table 2. Most of them we will not need for our terminal, but some will be very important. We definitely need to see the cursor, and word wrap will come in handy (this allows text to flow onto another line if it exceeds 80 columns). We must organize our program into a smooth-flowing, well-structured application if we want it to keep up with the demands of high-speed telecommunication.

Table 2.

VT-52 Escape Codes

ESC A	CURSOR UP
ESC B	CURSOR DOWN
ESC C	CURSOR RIGHT
ESC D	CURSOR LEFT
ESC E	CLEAR HOME
ESC H	CURSOR HOME
ESC p	REVERSE ON
ESC q	REVERSE OFF

The "main" loop will consist of two IF's: one to check for an incoming character, and the other to check for an outgoing character. With some thought, trial, and error, I found out that giving priority to an incoming character (checking INP(1) first) was the best method. Otherwise, every time you enter text before a prompt has been reached (storing it in the buffer of the host computer), the incoming text being printed to the screen pauses.

These two IF's must then call two other subroutines. These subroutines should handle special characters, and finally process the information.

Special characters to watch out for would be keys that you hit on the keyboard that will serve a function on your side of the terminal. What leaps to mind is the [UNDO] key, which is well-suited for handling the QUIT function. When you hit [UNDO], you don't want its value sent over to the host, so you must trap it before you send it.

Let's trace a character as it goes through the system. If I hit a key, INP(2) will pick it up. If it is not a reserved key, it should be sent to the modem with OUT 1,(value). Likewise, if a character is coming in, INP(1) will receive it, and it should be printed to screen with OUT 2,(value). These two operations are reciprocals.

Good luck, and happy telecomputing!

# ST PUZZLER

## A jigsaw puzzle generator for your ST

by David J. Bohlke

**S**T **Puzzler** is a simulation which will generate a random jigsaw puzzle for you to solve. A scoring routine will allow you to compete against your own best score on each new puzzle. You also have the option of changing the puzzle pattern so that you can adjust the difficulty level of the game.

To begin you will need to type in the ST BASIC listing. Be sure to save a copy or two to disk before you run the program. It is also necessary to set the display to low resolution from the control panel. If you have a monochrome-only display, you can try placing random patterns in the puzzle, as described later.

When you run the game, the random puzzle to be solved will be displayed in the bottom-right corner of the screen. The left two-thirds of the screen will show an 8×6 grid in which you will place the pieces in the puzzle. The piece you will need to place in the puzzle each turn will be randomly selected; and shown in actual size in the upper-right corner of the display. Each of these pieces and the completed puzzle grid are nine times as large as the original puzzle that you will be completing.

There are four types of prompts which will be printed in the OUTPUT bar on the top of the screen. When the computer is selecting a piece for you to place in the grid, and plotting the piece in the upper right of the screen, the message "Selecting piece" will be displayed. Then it will be time for you to place the piece in the puzzle,

and the prompt "Click to Grid" will be shown. To place the piece, use the mouse to move the pointer to the location in the grid you think the piece belongs, relative to the original puzzle from the lower right of the screen, then click the left mouse button.

If you are accurate in your selection, the message "CORRECT" will be shown; and if you miss the appropriate

---

The  
maximum  
score  
is a  
perfect 4800,  
with any  
score  
over 4000  
exceptional.

---

grid square the message "INCORRECT" will be printed. Each of the four prompts will also indicate your current score. The "CORRECT" signal also displays the number of right and wrong pieces you have attempted. When your placement is accurate, the piece will be put in the large grid that you pointed to with the mouse. When you are wrong, the

piece to place will be erased, and a new random piece will be chosen.

The scoring routine considers the number of right and wrong placements, and a timing factor. The timing counter begins when the piece to place in the upper right corner is completed, and ends when you click the mouse to pick your square. You can only click the mouse when the prompt "Click to Grid" is displayed. The maximum score is a perfect 4800, with any effort over 4000 exceptional.

Each puzzle is made up of random ellipse segments. Currently, the pieces are filled with the pattern labeled (2,7) on page C-21 of the ST BASIC Sourcebook. These numbers are engaged using the color statement in program line number 240. Notice the order used in the statement is 7,2. Using other patterns here is one way that you can increase or decrease the difficulty level of the jigsaw puzzle. If you do not have a color display, you might try using a `rnd*24` to pick a random pattern for each different ellipse drawn in the puzzle.

I really enjoyed writing Puzzler and experimenting with the different color combinations and patterns. After you are accustomed to play, you might try altering the elliptical shapes to boxes, circles, lines, or triangles. If jigsaw puzzles are one of your hobbies, you now have billions of options to enjoy.

Reviewed by Rick Teverbaugh

The game of pool is likely to experience a comeback, especially with the Fast Eddie Felson character Paul Newman created in "The Hustler" returning in Martin Scorsese's hit movie "The Color of Money." However, for those who prefer keyboard and mouse in the comfort of home to wooden cue and green felt table in a smokey pool hall, you have two choices of pool programs for your ST.

**8-Ball** and **ST Pool** are distinctively different programs, in that the scope of each game is drastically different. 8-Ball is limited to just that game of pool, while ST Pool gives you the table, cues and balls, inviting you to play whatever game that strikes your fancy. With ST Pool, you can create your own rack of balls, making it easy to play 8-Ball, 9-Ball, Rotation or whatever. 8-Ball keeps track of which player is up, and lines the balls sunk

behind that player's name. ST Pool presents beads at the top of the table to keep score manually; otherwise the program doesn't care which player is up.

There are advantages and disadvantages to each program. For example, 8-Ball limits the options of games available. True pool aficionados will likely favor this plan because they will be used to keeping score manually, so that chore won't seem unusual. But to the veteran computer gamer, it will seem too much trouble. Computer users are accustomed to the machine doing the dirty work, leaving them to have fun. 8-Ball tells which player is up, keeps track of scratches and much more.

At the beginning of the program, 8-Ball asks what will constitute a scratch. The choices are: hitting the ball off the table (yes, it's possible), not hitting a ball, hitting opponent's ball first, shooting backward after a scratch, and failing to cushion a ball. At game's end, the program will then deliver some specific information about each player's game. That data includes the number of shots, the number of turns, the number of scratches and the longest run of balls in one turn.

There are also other differences in the way each program executes the game of pool. The most unusual of these is in ST Pool. First, you have to position the pool cue with the tip over the white ball, using the mouse. Then, you use the mouse or the Con-

trol and Tab keys to aim the stick. In the most difficult mode, it is necessary to use line-of-sight vision to gauge where the ball will go. There is another option which projects a dotted line down the table, making it easier to judge when the shot is lined up properly.

After that, just executing the shot is no picnic. You have to hold the left mouse button down while drawing the mouse towards you to prevent changing your aim. This movement also pulls the cue stick away from the ball. Also, controlling how hard the ball is hit is accomplished in a novel manner. It doesn't matter how far the stick is away from the ball, the strength of the shot depends on the speed of the mouse movement back towards the ball. To develop a nice touch on the table will take hours of practice.

However, ST Pool will enable you to make some shots that would be impossible with 8-Ball. A box at the lower right-hand side of the screen shows the cue ball. A crosshair on that ball will help control the action of the cue ball when it hits the object ball. That makes it easier to position the cue ball on the table to set up a second shot.

The entire process is simplified in 8-Ball. The mouse moves the cue and controls the aim around the cue ball. A dotted line projects forward to aid your aim. The farther the stick is drawn back from the ball, the more force will be applied to the shot. You

can get a normal strength shot by using the left mouse button. The right mouse button will give a force about four times greater than the left, and is designed to be used mostly on the opening break shot.

8-Ball also avoids a problem that plagues ST Pool. Since 8-Ball only involves shooting at solid-colored balls or stripes and then the eight ball, all that is necessary for the table display is that you be able to tell the solids from the stripes and identify the eight ball. On the other hand, when you play Rotation, you have to be able to tell the number of the ball. That type of definition just isn't possible on a table cluttered with up to 16 balls at one time. ST Pool assumes you'll know which color the number one ball is, number two and so on. (Later versions of the game have a rules addendum on the disk you can print out and keep by the keyboard to aid in ball identification.)

There are some added touches on ST Pool that aren't really necessary, but are fun to toy with. You can change the table color, for instance. (Fortunately, it never gets dirty or worn.) Also, you can alter the size of the boxes containing the table and other options can be changed to suit your tastes.

That only leaves the action of the balls on the table as a means for comparison. Overall, 8-Ball has the most realistic action, although even it falters a bit when the cue ball goes crashing into a pack of closely-clustered balls. 8-Ball evidently handles each contact individually or in pairs, so it is almost a stop-action sequence until all the contact ends. However, the roll of the balls is smooth and realistic. Since there are many angle options for shots, it is less difficult to line up a shot.

ST Pool makes much more exacting demands for making shots. In the practice, one-player mode, it will take almost twice as long to clear the table in ST Pool as it will in 8-Ball. Also, the ball movement isn't quite as life-like. On one shot, I had two object balls bounce off each other, go to opposite bumpers and then back to hit each other again. That process

## DataTrieve

The electronic  
filing system  
for the ST

### ST DataTrieve

Data management was never this easy. Online help screens; lightning-fast operation; tailorable display; user-definable edit masks; up to 64,000 records. Supports multiple files. Includes RAM-disk programs. Complete search, sort and file subsetting. Interfaces to TextPro. Easy yet powerful printer control. Includes five common database setups. **\$49.95**

Word processor for the ST

### ST TextPro

Wordprocessor with professional features and easy-to-use! Full-screen editing with mouse or keyboard shortcuts. High speed input, scrolling and editing; sideways printing; multi-column output; flexible printer installation; automatic index and table of contents; up to 180 chars/line; 30 definable function keys; metafile output; much more. **\$49.95**

## PaintPro

For creative illustrations on the ST

### ST PaintPro

Friendly, but powerful design and painting program. A *must* for everyone's artistic and graphics needs. Up to three windows. Cut & paste between windows. 36 user-defined fill patterns; definable line patterns; works in hi-med- & lo-res; accepts GDOS fonts. Double-sized picture format. **\$49.95**  
PaintPro Library #1 5 fonts, 300+ electronic, architectural, borders & clip art designs. **\$19.95**

## Forth/MT

Multi-Tasking  
Full-Featured

### ST Forth/MT

Powerful, multi-tasking Forth for the ST. A complete, 32-bit implementation based on Forth-83 standard. Development aids: full screen editor, monitor, macro assembler. 1500+ word library. TOS/LINEA commands. Floating point and complex arithmetic. **\$49.95**

## AssemPro

The complete 68000  
assembler development  
package for the ST

### ST AssemPro

Professional developer's package includes editor, two-pass interactive assembler with error locator, online help including instruction address mode and GEM parameter information, monitor-debugger, disassembler and 68020 simulator, more. **\$59.95**

## PowerPlan ST

Full-powered Spreadsheet  
37 math functions - 14 digit precision  
Large size - over 4.2 billion cells  
Multiple windows - up to 7  
Graphics - 7 types of graphs

### PowerPlan ST

Powerful analysis package. Large spreadsheet (65536 X 65536 cells), built-in calculator, notepad, and integrated graphics. 37 math functions, 14 digit-precision. Seven windows to show one of seven types of charts or another section of your spreadsheet. **\$79.95**

# BASIC ALERT

## Creating alert boxes in ST BASIC

by Ron Schaefer M.D.

One of the most valuable and user friendly parts of the ST's GEM operating system is the alert box. The alert box is a very familiar object to the ST user. It's that rectangle that pops up in the middle of your screen, usually before you are about to make a change to your file. It can ask you to make decisions (such as EXIT, CANCEL, etc.) simply by clicking your mouse button on another "button," actually, a smaller rectangle at the bottom of the alert box.

To create an alert box using ST BASIC is a relatively simple matter. For instance, you can pass some parameters to a subroutine which will then do all the dirty work (PEEKing and POKEing). The alert box or the GEMSYS(52) call, is part of the Application Environment Service, or AES for short. Before using any AES application you must first initialize a few variables, as demonstrated in the subroutine called INITAES. These variables are set equal to constants and need to be defined only once in a program, but this must be done before you attempt to make any GEMSYS calls. Not all of these variables are used by every AES application, but I have found it easiest to initiate them all at once, then forget about them.

Let's walk through the program. Line 10 is a comment. Line 20 calls the subroutine INITAES, and opens and clears the output window. Line 30 sets the type of icon that will appear on the left side of the Alert box. I did this by setting the string variable TYPE\$ equal "1", the exclamation mark, "2", the question mark, "3",

the stop sign, or blank "", which prints nothing. Also, in line 30 the text appearing in the alert box is set equal to the string variable TEXT\$. According to ST reference books, you can have up to five lines of text, each line up to 40 characters long. However, whenever my text got over 4 lines long or over 30 characters per line my system started crashing, so I kept within these constraints.

---

To create  
an alert  
box  
using  
ST BASIC  
is a  
relatively  
simple  
matter.

---

The string TEXT\$ can be more than one line long, each line separated by a "|", a character you get by pressing [SHIFT]\ This "|" serves the function of a carriage return, telling the alert box to start a new line. Text should not contain square brackets "[", or "]" since these have special meaning to the GEMSYS(52) routine.

In line 40 the text appearing in the buttons is set equal to the string

BUTTON\$. There can be from one to three buttons, with a maximum of 20 characters total. The different buttons are separated by a "|". Also in line 40 the default button is set. If it is set equal to 0 there is no default, otherwise one of the buttons is highlighted, and when a carriage return is pressed it has the same function as clicking on that particular button. Line 50 calls the subroutine DOALERT. Lines 60 through 80 print out a message, depending on which button you click.

The subroutine DOALERT starts on line 120. Line 130 sets a double precision variable "N#" equal to the memory location where the parameters must be POKed in order to create an Alert box. Line 140 sets the default button as explained above. Line 150 generates the string ALERT\$, which is a concatenation of the variables TYPE\$, TEXT\$, and BUTTON\$, separated by square brackets. In line 160 the command VARPTR pokes the address of the string variable ALERT\$ into the spot where the GEMSYS(52) routine will look for it. Line 170 calls the routine to generate an alert box. Finally, line 180 looks for which button you clicked and sets it equal to the variable CHOICE. A word of caution: When using GEMSYS commands it is very helpful if you frequently save your program. These commands are very finicky, and if they are not executed perfectly, they have a tendency to lock up or crash the system.

(209) 533-8349  
\$39.95

CIRCLE 262 ON READER SERVICE CARD

Reviewed by Patrick Bass

Looking for a battery-backed ST clock but don't want to lose the use of your cartridge port? The **Timekeeper** by Navarone Industries is just what you had in mind. The Atari-silver Timekeeper plugs into the Atari ST cartridge port, but provides a "feed-through" cartridge slot to allow the Timekeeper to remain installed when using other cartridges.

The Timekeeper comes with the correct time and date already programmed in. Along with the cartridge, Navarone provides software on disk which includes a desk accessory clock and a standard .PRG time-setting program.

On powerup, the software automatically gets the time and date from the Timekeeper and sets the ST internal clock. Then it disengages itself. Your files will always be properly time- and date-stamped. No more guessing when the last update was. The desk accessory clock includes an "Alarm Clock" function, which you set to the time you desire the alarm to sound. When the alarm trips, the desk accessory pops up on the screen and a warbling two-tone alarm comes ringing out of the video speaker.

The built-in battery should last upwards of ten years. I've had

Timekeeper plugged in for over a week now, and haven't lost a second. If you need a battery clock, but also need to keep your cartridge port, look long and hard at this \$39.95 wonder.

## MEAN 18

Reviewed by DeWitt Robbeloth

Armchair golfers will enjoy playing **Mean 18** if they can ever get beyond the practice tee. The instructions confused me so much I almost gave it up. But once on the course, I found challenging amusement where physical coordination, concentration, judgment and an attractive environment all translated nicely from real golf to the computer.

Three careful clicks of the mouse button simulate a golf swing. The timing of the clicks, cued by a visible "power gauge," determines the extent of your backswing and the moment of impact with the ball. Perfect timing results in a shot down the middle with maximum distance for the chosen club. Slight timing variations cause hooks and slices and loss of distance, so you can rarely play a shot the same way twice. Even short putts are tricky, requiring rapid clicking to avoid overpowering the ball.

You also control your shots in two other realistic ways—choice of 14 clubs and direction of shot. Scrolling lets you shoot to the side, for example, to escape a tree, or to play a deliberate hook.

Mean 18's four courses are Augusta, Pebble Beach, St. Andrews, and Bush Hill Country Club. Each realistic hole begins with a tee facing down the fairway. Trees, bunkers, streams and rough are all strategically placed to intercept the errant shot. In the distance you see the green and flag, if they're not hidden by the terrain.

Your onscreen golfer, toggled in color-coded shirt, addresses the ball. As you click your mouse, the golfer swings and sends a white dot arcing towards the pin. The ball drops, bounces and comes to a stop according to the computer formula. When you click again, the scene changes to represent the vista from the ball's new position.

When your ball finally lands on the green, you first see an overhead view of the whole green and its contours, the hole and the positions of all balls on the green. Then the scene narrows to the distance between your ball and the hole. The computer displays an aiming line for your putt, which you adjust with the mouse. When the line seems right, the clicker putts the ball.

On my first round I shot an 85 against a par of 72. Not bad. If you need more challenge, choose the pro tees to increase the distance, or play in expert mode where the computer does not suggest the proper club nor line up the shot. Stroke play (lowest total) or medal play (most holes won) are available.

Of course the computer keeps score, and tells whose shot it is (which can get confusing when you're pretending to be a foursome all by yourself). You see the scorecard after each hole, and you can post outstanding scores to the Hall of Fame. If your game is interrupted, save it to disk and return to it later.

The graphics of **Mean 18** deserve praise. With great simplicity, computer-artist George Karalias paints a pleasant and convincing golf setting. If you ever tire of the initial four courses, design your own with the Course Architect—essentially a golf-course construction set included on the disk.

My beef with this game is the instructions. Originally written for the

# STARGLIDER

## A fantastic space warfare simulator for your ST

Reviewed by DAVID PLOTKIN

**Starglider** is an extraordinary combat simulator. Its combination of strategy and outstanding graphics demands hair-trigger reflexes, providing a thoroughly enjoyable gaming experience.

Starglider is the classic "one vessel against overwhelming odds" scenario. When your home planet of Novenia was overrun by the Egrons, only the outpost on Novenia's moon was left intact. There, you discover a museum piece—an AGAV, or Airborne Ground Attack Vehicle. After fitting it with advanced weaponry and rocket boosters, you fly it from the moon to Novenia, there to do battle with the hordes of enemy invaders. At stake is not only the fate of Novenia, but of your friends left behind at the moon base, who will perish unless additional supplies reach them soon from Novenia.

When you reach Novenia, the hordes of enemies will give you pause. There are numerous types: The (apparently) invincible walker (shades of "Empire Strikes Back") is the most imposing, but there are also fighter aircraft, tanks, missile launchers, floating mines and other nasties, all rendered in gorgeous color. Most of these will fire furiously at you, and it will take all your skill to avoid them and return fire. You will also have to deal with the flagship of the enemy fleet, StarGlider 1.

Your AGAV is equipped with twin

lasers and computer-aided targeting, as well as guided missiles—if you can find any. There is nothing so satisfying as blowing an enemy tank to bits with multiple hits from your laser! Your AGAV also has a force field which will give limited protection from enemy fire. From the moment you descend to Novenia, you will have your hands full. Besides flying your ship, monitoring forward speed

and altitude (hitting the ground is very hard on your shields), you must keep an eye on your laser energy, shield energy, and flight energy. As you duke it out with enemy forces, you will also have to figure out how to recharge your various energy sources. Not all of them can be recharged in the same place. It's actually not too hard to figure where and how to get energy—read the documentation carefully.

Your AGAV is controlled by the mouse. The control systems uses both mouse buttons for altitude, speed, and fire control. It is a little confus-

ing at first, but you soon get the hang of it. Once you do, Starglider becomes a lot of fun. You can also control the AGAV from the keyboard, although I think the mouse is much easier. The default keys are strange choices, but you have the option of defining your own control keys before starting the games. Thus, you can control your AGAV using the cursor arrow keys if you wish.

Your view is out the cockpit, and the graphics and animation are simply amazing. You appear to be moving over the surface of a darkened planet, with structures and enemies depicted in vector graphics. The documentation, consisting of a novella, flight manual and quick reference sheet, gives quite plausible reasons why the planet is dark and why you can see through buildings and vehicles. Moving your mouse left and right alters your flight direction, allowing you to line up your sights on targets and blast away with your lasers. Enemies explode convincingly, scattering pieces. Digitized sound and voice complete the realistic simulation of combat.

The strategy required for Starglider is pretty intuitive. For example, if you are "waxing" an enemy fighter's tail, blasting away (it may take quite a few hits before it explodes), you may need to adjust your speed so as not to let him get away or get too close. A burst

continued on next page

of speed may also be needed to shake a missile from your tail, and it is often wiser to run than take on a missile launcher that never seems to run out of missiles!

The ultimate aim of Starglider is the destruction of the enemy flagship. After destroying a variety of enemy forces, Starglider 1 will make an appearance. No sense in wasting laser fire: The flagship is impervious. The only weapon that has any effect on Starglider 1 is a missile. These can be obtained at the supply silos, but only one at a time. When you launch a missile, your cockpit screen switches to show the view from the missile, and you use your mouse to guide it towards the madly evading flagship. Only one place on Starglider is vulnerable, and it is difficult to hit. Successfully hitting that spot (under the tail) advances you to the next level. Three hits will destroy the flagship, causing Egron forces to surrender.

As you would expect, each successive level is harder. But not just be-

cause things occur faster, as would be true of an ordinary arcade game. What happens is that the enemy gets smarter and adjusts his strategy to make your life miserable. Heavy concentrations of tanks begin appearing around the supply silos and energy recharge towers, and it gets ever more hazardous to refuel. Further, there seems to be no end to the missiles the Egrons throw at you, and the missiles can track you more accurately at the higher levels.

The documentation which comes with Starglider is delightful. Not only is the novella informative, but funny as well, with historic references (if you are a history buff) to the likes of Hermann Goering (in charge of the Luftwaffe—airforce—of Nazi Germany during World War II). In fact, the commander of the Egron forces is a character named Hermann Kruud, who swaggers and has delusions of grandeur very much like Goering. The novella is also full of references to the designers and programmers of

Starglider, with backwards names abounding.

The bright colors, smooth animation and digitized sound of Starglider make for an impressive gaming experience, full of challenges and fun. I would have preferred slightly less overwhelming odds to fight against, and the inability to save high scores to disk (they are lost when you turn off the computer) is sorely missed, but I think that this game is destined to become a classic. It really shows off what the ST can do. If you are hungering for a high-resolution challenge, this game is for you.

Now excuse me, I have a date with some Egrons. . .

IF YOU LIKED "SUNDOG" YOU WILL LOVE PIRATES OF THE BARBARY COAST

#### PIRATES OF THE BARBARY COAST

PIRATES OF THE BARBARY COAST is a one-person, strategy action game based on the true facts of the Barbary Coast Pirate days in the late 18th Century. It is basically a trading game, in which the player is the captain of a trading frigate who has to trade in the various Barbary Coast seaport towns in order to raise the ransom money to get his daughter back from Bloodthroat the Pirate. He has a limited time period in which to do this. The game also features the option of finding a buried treasure on one of four possible islands. Once the captain has located Bloodthroat, he can go to Bloodthroat's hideout and either pay the ransom, fight the Pirate, or both. Along the Player's travels, he will encounter hostile Pirate fleets who often attack his ship.

## THE AMAZING VOICE MASTER®

### ENTER THE FINAL FRONTIER OF MAN-TO-MACHINE COMMUNICATIONS

There is nothing else like it. Voice Master gives both speech output and voice recognition with this single hardware product! Your voice controls programs, or home appliances, robots, and more with spoken commands. Verbal response back gives status, verifies, or requests your reply! Speech output and recognition patterns are recorded in with your voice. Or use the voice of your friend, boss, teacher, mother, even the family pet! Programming is simple with new commands added to BASIC. A music bonus program lets you write and compose musical scores simply by humming the tune. Unlimited applications for fun, education, and commercial use. Design your own programs for profit. Speech and recognition quality unsurpassed by even the most sophisticated machines. Only Covox provides this high-tech marvel at a price less than most common peripherals.

The Covox Voice Master comes complete with all hardware and software for only \$89.95. (Add \$4 shipping and handling for USA, \$6 Canada, \$10 overseas.) Available for Commodore 64/128, Apple II, II+, IIc, IIe, Atari 800, 800XL, 130 XE. Specify when ordering. Visa, MasterCard phone orders accepted.

Call or write for FREE Voice Master Infopak and special combination package offers.

## ST PRODUCT REVIEWS

continued from page 70

IBM, the slim instruction pamphlet failed completely to orient me to the ST version. A 3x5-inch insert attempts to explain changes for the ST, but essentially it only says to substitute "mouse click" for "space bar." There's no explanation of the practice tee or practice green, where every novice player naturally proceeds—and where almost nothing works as the instructions say they do, although the instructions are correct for the main course. It's a shame that such a colorful and interesting game is almost torpedoed by shortsighted documentation.

### MIDI MAGIC

Micro-W Distributing Inc.  
1342B Route 23  
Butler, NJ 07405  
(201) 838-9027  
\$49.95

CIRCLE 279 ON READER SERVICE CARD

Reviewed by Jim Pierson-Perry

As I write this review, the ghost of Ge-

orge Gershwin is rolling into high gear playing "Rhapsody In Blue" on my Casio synthesizer. And when he finishes, some of his friends will take over to play "The Old Piano Roll Blues," "Do You Think I'm Sexy?" and others.

MIDI Magic allows the ST to read music disks and send the data, via the ST MIDI ports, to any MIDI-compatible instrument. It comes with a connecting cable for the ST to the instrument, a demo disk with six songs and a catalogue of available music disks (currently 103 at \$19.95 apiece). As the music plays, the screen shows a player piano with the corresponding piano roll winding through it.

The programmer of the ST version of MIDI Magic is Tom Jefferies, who also gave us the MIDI sequencer in the premiere issue of START magazine. Both programs use a basic MIDI protocol with all notes sent on one channel in polyphonic mode. For best results, the receiving instrument should be capable of sounding at least eight notes at once (e.g. Casio CZ-101,

Yamaha DX-7) or there might be a noticeable loss of music quality.

A standard approach would be to use a synthesizer set to sound like a piano as the receiving instrument to give the full effect of a simulated player piano. While this works well, I've had fun with more unusual synthesizer sounds, such as Madonna's "Material Girl" played by eight invisible whistlers, or the Beach Boys' "California Girls" on bagpipes. Of course with MIDI just about anything goes, so if you want to send the music data to a sampling keyboard set to respond as harmonic barking dogs—go for it.

Be aware that MIDI Magic is a "playback only" program—you can't use it to record your own playing. It does what it claims—acts as a computer-age player piano—and does it well. I recommend this as a good example of what the marriage of the Atari ST and MIDI can do—not to mention the great fun. Now if you will excuse me, George is done and I think I'll let Eubie Blake try playing some ragtime on a trumpet section.

## WE LET THE *CRITICS* SPEAK FOR US

"PCA's GRAPHIC ARTIST is a very sophisticated program that manipulates graphics and text for sending to a plotter, laser printer, or dot matrix printer. GRAPHIC ARTIST has professional level ambitions in Computer Aided Design (CAD), business graphics and desktop publishing. You can create some great on-screen graphics with the GRAPHIC ARTIST, but the program's real purpose is to print its end results..." - Antic Publishing

"The ability to painlessly manipulate text, use an endless variety of pre-made and user-defined fonts, integrate text and graphics within a document, create presentation graphics - all these make (the GRAPHIC ARTIST) an outstanding program. This capability has not previously been available to the home user." - ANALOG's ST-LOG

"This program offers more than page assembly.... It also includes CAD, a spreadsheet, word processing.... (The GRAPHIC ARTIST) is so full of features, its hard to begin listing them." - Personal Publishing

"The GRAPHIC ARTIST is one of the first programs that tries to take advantage of the tremendous power of the ST ... the first ST program to use the printer to its highest resolution and the results are extremely impressive." - CURRENT NOTES

# HIPPO SOUND DIGITIZER

An easy-to-use sound digitizer for your ST

Reviewed by Patrick Bass

I want this product.

I can't use this product.

No, the above is not a textbook example of dichotomy, it's how I feel about the **Hippo Sound Digitizer**. First, however, let's explore it and then get back to my petty wants and desires.

The Hippo Sound Digitizer (hereinafter known as HSD) is a eight-bit resolution hardware/software combination which allows you to digitize sound with your Atari ST computer. The HSD hardware consists of a dove-grey box about half the size of an ST disk drive, which plugs into the cartridge slot of the computer. The box has two external control knobs for adjusting input and output level. On the back you'll find 1/4 inch standard phone jacks for sound input and output.

Notice that word output. You'll need an external amplifier to hear the sounds you've digitized, since there seems to be no way to play the sounds back through the TV speaker. I spent about 15 frustrating minutes before I found a reference to "adjusting the level of your amplifier" buried in the HSD manual. They should have made this apparent in the "Setting Up The Unit" section. Incidentally, patch cords are not provided.

The HSD software comes on a 3.5 inch disk, and contains both the digitizer software and sample sounds. HSD works on either color or monochrome Atari ST systems. To actually operate the digitizer, from the desktop, double-click on SOUND.PRG, and in a few seconds you'll see the HSD title screen pop up. There are four choices presented along the bottom of the screen.

On the left is "Command", which will present the main control panel for interacting with HSD. Next comes "O-scope", which presents a digital oscilloscope onscreen so you may watch the waveform of the incoming sound. To the right of that is "Rack," which presents a screen from which you may add reverb or echo to incoming or existing sounds, and finally, on the right is "Exit", which drops you back to the GEM desktop.

## COMMAND

The command screen is where you'll spend most of your time. Let's examine it closely. Most of the upper half of the screen contains an editing window, where the sound waveform is displayed and edited from. The upper right of the screen contains a "gas gauge" display of memory used for the sound and memory left in the cut/

paste buffer. The lower half of the screen contains buttons for 24 different functions.

First, you may LOAD or SAVE a sound file. The STATS button updates the display concerning playing time, number of samples, sample rate, and percentage of modulation concerning the average amplitude of the signal. The MIDI button sends sampling out through the MIDI port in the back. You may ADJUST RATE, either for the entire sound or just for a selected section of the sound, and vary the VOLUME, again either for the entire sound or just for a selected section.

HSD allows you to define your own wave shape and ADSR envelope, for completely unique sounds created from your own imagination. Also, at any time during editing of a sound, you may UNDO your last action.

You may MIX, or overlay, (sound with sound) one voice or instrument on top of another one. For example, select one sentence of a person talking, cut out a copy and save it in the cut buffer. Then, MIX the sound in the buffer back in with the original sound many times, each one starting a fraction of a second sooner or later than the last. The result? A "crowd" of people saying the original sentence

continued on next page

(more or less) in unison.

You may select a section of sound and SQUEEZE it to raise the pitch up one note, or you may STRETCH it out to lower the pitch. For multiple SQUEEZES and STRETCHES, you may double-click on the buttons, then type the number of times to repeat into the resolution dialog box.

Ever play Beatles' records backwards? With the REVERSE button, you could record and select the voice saying "Number Nine. . . Number Nine. . ." from the White Album and play it in reverse, confirming for yourself what the Beatles were really saying. (I have, and no, I'm not saying.)

The next four buttons all work together. CUT will remove the selected section of sound and place it into the cut buffer. COPY just makes a copy of the sound and places it into the cut buffer, without removing it from your original sound. INSERT copies the sound in the cut buffer to wherever the cursor is in the current sound being edited. REPLACE will remove the selected section of sound on the edit screen and replace it with the sound stored in the cut buffer.

When you click on SHOW ALL, the entire sound is displayed in the edit window along the top. The left side of the edit display shows the time the selected sound starts, and the right side of the display shows what time the sound ends. SHOW ALL is needed, because using the ZOOM IN and ZOOM OUT buttons, you may zoom in on a selected section of sound until the individual peaks and valleys of the sound waveform itself are visible.

This can have a very important function. For example, record a selection of music off an old record. Now play the section of music back, and if the record was old enough, you'll hear clicks and pops in the sound where the record has deteriorated. On the edit screen, you can see the clicks and pops, as they are louder than the music around them. Now ZOOM IN on a single click or pop, and cut it out of the music. The two ends of the song will seal together automatically, leaving just music, no clicks or pops.

Finally, you may PLAY the entire recorded sound, or just a selected

The complete Hippo Sound Digitizer kit.

piece of it. To select a section of sound, point the cursor at the left edge of the sound you wish to select, then click-drag the mouse to the right. The selected section of sound will be highlighted.

Above the PLAY button is DIGITIZE, which starts the HSD sampling the input sound and stores it in memory. Last is the SET TIME button, which allows you to determine how long the digitization lasts.

## O-SCOPE

Click on O-SCOPE, and the screen becomes a digital oscilloscope displaying the incoming sound as a waveform on your TV screen. This screen is used for setting the level of the incoming sound for use with the digitizer.

## RACK

RACK is a screen containing controls for inserting echo or reverb information into a previously digitized and stored sound, or for adding reverb or echo to the sound currently being digitized.

## STORAGE CAPACITY

Just how much sound can be stored at one time? Basically, it depends on how fast you sample the sound when you digitize it. There are rules in digital sound recording which state that in order to *properly* digitize the incoming sound, you must take *twice* as many samples (per second) as the highest expected incoming frequency. The HSD will sample sound up to 200 kilohertz (Khz) and signals up to five volts.

This, for example, means that to record a high-fidelity sound whose highest note is around 20 Khz, we must take 40 thousand samples per second. For voice, where the highest note is more like 5 Khz, a sampling rate of 10 Khz should work fine.

Each "sample" of sound is stored in one byte of memory. This means 20 thousand samples would take up 20 thousand bytes of memory. In an Atari ST with one megabyte of memory, there are roughly 800,000 bytes free for sound storage.

So, with a little math we can see that high-fidelity music sampled at 40

Khz should give us (800,000 / 40,000) 20 seconds of recording capability. A slower sampling rate, for instance, gives a correspondingly longer recording time. For example, voice sampled at 10 Khz should result in (800,000 / 10,000) 80 seconds, or nearly a full minute and a half, of digitized, editable sound.

Now this may be a case of not seeing the Emperor's new clothes, but I can tell very little difference (if at all) between music sampled at 40 Khz and music sampled at 20 Khz. If you can't tell the difference either, then you've just found a way to double your recording time.

## NITPICKING

Overall, the product is solid and usable. . . to an extent. For me, I was disappointed to find there was no *apparent* easy way to include my digitized sounds into my own programs. Like in Jez Sans' StarGlider, I'd like my panel to say "Systems alert!" instead of beeping at me. (With that English accent, of course. Who is she?) On the other hand, Hippo does reveal the file structure of the sound files created and they do include programming examples of how to capture digitized sound and how to drive the digitizer with your own sound data.

But . . . If I were running a radio or TV station, or worked in a recording studio, this one package would allow me to compose and edit complete commercials without ever putting sound on tape. I could cut, paste, and distort any sound I could hear, and even some I couldn't. I would want this package greatly, even to the point of buying an ST just to drive it.

Think of this . . . a complete package of HSD and the Atari 1040ST costs less than one-tenth the cost of a studio digital tape recorder. And the digital tape recorder won't play Time Bandits or Flight Simulator II. . .

## APL. 68000 for the Atari ST

APL. 68000 is a highly optimized 68000 Assembler based APL Interpreter which takes full advantage of the Atari ST features including user-defined pull-down menus and Dialog and Alert boxes. All this, along with a complete interface to ST graphics, are the reasons that APL. 68000 on the Atari ST sets the industry standard for performance and capabilities.

## BACKUP PROTECTED SOFTWARE FAST.

From the team who brought you COPY II PLUS (Apple), COPY II PC (IBM) and COPY II MAC (Macintosh) comes a revolutionary new copy program for the Atari 520 and 1040 ST computers.

COPY II ST copies many protected programs automatically.

- Supports single and double sided drives.
- Includes a sector-based copier for fast, reliable copies of unprotected disks.
- Includes a bit copy mode for protected disks.

Requires an Atari 520 or 1040 ST computer with one or two drives.

Call 503/244-5782, M-F, 8-5  
(West Coast time) with your   
in hand. Or send a check  
for \$39.95 U.S. plus \$3 s/h, \$8  
overseas.

## ANIMATOR ST

**Animator ST** from Aegis uses a concept called "tweening" to control the movement of objects during an animation, breaking it up into manageable units. You can create objects within the program and, for instance, change a pyramid into a star by dragging the points of the pyramid to the proper positions. When that tween is replayed, Animator ST creates all the in-between positions of the shape. The program also features color-cycling, in which repetitive movements can be animated, and cels created in NEOchrome can be page-flipped.

\$79.95. Aegis Development, 2210 Wilshire Blvd., Suite 277, Santa Monica, CA 90403. (213) 392-6445. PRESS.

## THUNDER! FOR HEARING-IMPAIRED

Batteries Included's **Thunder!** now lets people with impaired hearing use the program's real-time spelling checker. Instead of beeping, the new version of Thunder! alerts you by blinking the screen. Now you can see when a spelling error has been detected. This special version is available free with the return of the original disk.

Batteries Included, 30 Mural Street, Richmond Hill, Ontario L4B 1B5, Canada. (416) 881-9941. PRESS.

## NEC CP6 AND CP7

The 24-pin NEC **CP6** (80 columns, \$860) and **CP7** (136 columns, \$1,160) Color Pin-writers give you eight colors and 360×360 dots-per-inch resolution for graphics, and high speed (180 cps in draft mode) and letter quality for text. These quiet printers are compatible with the Epson LQ Series and JX80. COMDEX saw the announcement of option kits including buffer expansion and extra font capability for the CP6 and CP7. NEC's new P9XL (\$1795) prints text at 400 cps in draft mode.

NEC Information Systems Inc., 1414 Massachusetts Avenue, Boxborough, MA 01719. (617) 264-8000. PRESS.

## DR. T'S MUSIC SOFTWARE

The **Keyboard Controlled Sequencer** (KCS, \$195) operates in track mode, a 48-track computerized tape recorder; song mode, for convenient chaining of se-

quences into songs; and open mode, for flexible structuring. Memory capacity is 16 songs, 126 sequences and about 50,000 notes on the 520ST (130,000 on the 1040ST). Beginners might fancy the **MIDI Recording Studio** (\$39), a bare-bones version of the KCS track mode providing six-track recording. **The Copyist** (\$195) is a publication-quality score editing and printing program loadable from the KCS and having access to its data and play functions.

## FLEET STREET EDITOR

This desktop publishing package (about \$150 in English pounds) has a complete disk of library graphics and is ideal for newsletters, sales bulletins, restaurant menus and circulars. The two Fleet Street Publisher packages for the ST let you produce multi-page documents with editable page layouts and more, in addition to those features offered at the Editor level. Features include kerning (changing the spacing between characters to make words more attractive), picture sizing, cropping and output to dot-matrix or laser printers.

Mirrorsoft, Maxwell House, 74 Worship Street, London EC2A 2EN. 01-377 4645. PRESS.

CIRCLE 232 ON READER SERVICE CARD

## TYPESETTER ELITE

Mouse- and menu-driven **TypeSetter Elite** has 23 built-in fonts and the ability to load custom fonts. Underline and outline text, change intensity, copy and move text, grab entire screens and print a full page, screen dump, free form, index cards, labels or Rolodex cards. TypeSetter Elite supports both color and monochrome systems with equal resolution, and you can preview your output before printing. A text formatter is provided to move ASCII files into the program.

# STIMULATION

## FROM THE WORLD'S LARGEST ST PUBLISHER

### STupendous!

#### *Karate Kid Part II*

Guide Daniel through fight after fight against ever more powerful adversaries. Then face the evil Chozen himself in the Castle of King Shohashi, where you must discover the secret of the drum - or die! But the fighting isn't all: Catch flies with chopsticks and break ice with your bare hand in full-color, animated graphic sequences. Daniel LaRusso faced the challenge and became a hero. What will you do?

Color only. **\$39.95**

### STaggering!

#### *Shuttle II*

It's the 1990's and this new Shuttle can take off and fly with the minimum of controls. Decide the launch and landing details then take the seat of Flight Commander for liftoff. Find a faulty Satellite and go out with your jet pack and haul it in. Then return to Earth. Can you keep from burning up? Can you land without crashing? Find out now in this fantastic simulation!

Color only. **\$39.95**

### STunning

#### *Pinball Factory*

Play great pinball and even design your own screens. Place tabs, bumpers, and ball traps to get the action just right, then use the powerful drawing system to put in the walls. Add flair with a graphic logo. You can even set the scoring, gravity, speed and elasticity! Play the best pinball game you can imagine! There are even tilt controls to let you "bump" the machine!

Color only. **\$39.95**

### STriking!

#### *Eight Ball*

The poolhall favorite is here! Realistic graphics and ingeniously simple mouse control make this one a sure bet.

Color or Monochrome. **\$29.95**

#### *Trivia Challenge*

Nearly 4000 questions on International Sport, The Arts, Pop Music, Science and General knowledge. Arcade style play keeps the game quick. You can even put in your own questions!

Color or Monochrome. **\$39.95**

Dealer inquiries welcome • Visa and Mastercard accepted • Add \$3.00 shipping and handling to each order.

HOW TO USE TYPO ST .....86

**DISK SUBSCRIBERS:** Programs for 8-bit Atari computers can be used immediately. Just follow instructions in the accompanying magazine articles. ST Owners: See monthly disk's ST Help File for instructions on how to transfer programs to 3-1/2 inch disk.

No part of this publication may be reproduced, stored in a retrieval system, or transmitted, in any form or by any means, electronic, mechanical, photocopying, recording or otherwise, without the prior written permission of the publisher.

Antic program listings are typeset on the Star's SB-10 printer—from Star Micronics, Inc., 200 Park Avenue, New York, NY 10166.

# TYPING SPECIAL ATARI CHARACTERS

Antic printed program listings leave a small space between each Atari Special Character for easier reading. Immediately below you will see the way Antic prints all the standard Atari letters and numbers, in upper and lower case, in normal and inverse video.

```

ABCDEF GHI JKLMNOPQRSTU VWXYZ
abcde fgh i jklmnopqrstu vwxyz
0123456789 0123456789
  
```

The Atari Special Characters and the keys you must type in order to get them are shown in the two boxes below.

NORMAL VIDEO				INVERSE VIDEO			
FOR THIS	TYPE THIS	FOR THIS	TYPE THIS	FOR THIS	TYPE THIS	FOR THIS	TYPE THIS
CTRL ,		CTRL S		CTRL X		CTRL X	
CTRL A		CTRL T		CTRL Y		CTRL Y	
CTRL B		CTRL U		CTRL Z		CTRL Z	
CTRL C		CTRL V		ESC		ESC	
CTRL D		CTRL W		SHIFT CLEAR		SHIFT CLEAR	
CTRL E		CTRL X		ESC SHIFT INSERT		ESC SHIFT INSERT	
CTRL F		CTRL Y		ESC CTRL TAB		ESC CTRL TAB	
CTRL G		CTRL Z		ESC SHIFT TAB		ESC SHIFT TAB	
CTRL H		ESC ESC		CTRL .		CTRL .	
CTRL I		ESC CTRL -		CTRL ;		CTRL ;	
CTRL J		ESC CTRL =		CTRL *		CTRL *	
CTRL K		ESC CTRL *		CTRL .		CTRL .	
CTRL L		CTRL .		CTRL ;		CTRL ;	
CTRL M		CTRL ;		CTRL =		CTRL =	
CTRL N		CTRL =		ESC SHIFT CLEAR		ESC SHIFT CLEAR	
CTRL O		ESC DELETE		ESC TAB		ESC TAB	
CTRL P		ESC TAB					
CTRL Q							
CTRL R							

Whenever the CONTROL key (CTRL on the 400/800) or SHIFT key is used, *hold it down* while you press the next key. Whenever the ESC key is pressed, *release* it before you type the next key.

Turn on inverse video by pressing the Reverse Video Mode Key . Turn it off by pressing it a second time. (On the 400/800, use the Atari Logo Key instead.)

Among the most common program typing mistakes are switching certain capital letters with their lower-case counterparts—you need to look especially carefully at P, X, O and 0 (zero).

Some of Atari Special Characters are not easy to tell apart from standard alpha-numeric characters. Usually the Special Characters will be boxed. Compare the two sets of characters below:

SPECIAL		STANDARD	
	CTRL F		SHIFT +
	CTRL G		SHIFT -
	CTRL N		-
	CTRL R		+
	CTRL S		+

# HOW TO USE TYPO ST

TYPO ST is the automatic proofreading program for checking **Antic's** ST BASIC type-in listings. It finds any program line where you made a typing mistake.

Type in TYPO ST and SAVE a copy to disk before you RUN it. Now type RUN in the command window and press the [RETURN] key, or click on RUN from the RUN menu.

TYPO ST first asks for the name of the file to check. Type the desired filename and press [RETURN]. (TYPO ST will proofread itself if you type TYPOST.BAS as the filename.) Next, TYPO ST asks where you want the TYPO table printed. Type [S] [RETURN] for Screen, or [P] [RETURN] for Printer.

TYPO ST now reads your ST BASIC program and prints out a table of four-number codes—and the line number for each code. Compare your printed TYPO ST table with the **Antic** TYPO ST table published at the end of the program you are checking. If any of your four-number codes don't match the magazine's codes, you have made a typing mistake somewhere in that line. Carefully recheck your line against the published version.

**Antic** uses a word processor to format ST BASIC listings for publication, so we can indent lines and make the program structure more understandable. ST BASIC doesn't allow indentation and will strip off any spaces between the line number and the first BASIC instruction. Therefore, TYPO ST ignores space characters and does not care how far instructions are spaced apart.

TYPO ST cannot determine if two different characters have been switched within a line. For example, PRINT and PRNIT will look the same to TYPO ST. However, ST BASIC itself catches this error and points it out to you.

# HOW TO USE TYPO II (8-BIT)

TYPO II automatically proofreads **Antic's** type-in BASIC listings for 8-bit Atari computers. It finds the exact line where you made a program typing mistake.

Type in TYPO II and SAVE a copy to disk or cassette. Now type GOTO 32000. When you see the instruction on the screen, type in a single program line **without the two-letter TYPO II code** at the left of the line number. Press the [RETURN] key.

Your line will reappear at the bottom of the screen with a two-letter TYPO II code on the left. If this code is not exactly the same as the line code printed in the magazine, you mistyped something in that line.

To call back any line previously typed, type an asterisk [\*] followed (without in-between spaces) by the line number, then press [RETURN]. When the complete line appears at the top of the screen, press [RETURN] again. This is also the way you use TYPO II to proofread itself.

To LIST your program, press [BREAK] and type LIST. To return to TYPO II, type GOTO 32000.

To remove TYPO II from your program, type LIST "D:FILENAME",0,31999 [RETURN] (Cassette owners LIST "C:"). Type NEW, then ENTER "D:FILENAME"[RETURN](Cassette—ENTER "C:"). Your program is now in memory without TYPO II and you can SAVE or LIST it to disk or cassette.

Don't type the  
TYPO II Codes!

# MODULA-2

the successor to Pascal

FOR  
ATARI  
520ST

- FULL interface to GEM DOS, AES and VDI
- Smart linker for greatly reduced code size
- Full Screen Editor linked to compiler locates and identifies all errors.
- True native code implementation (Not UCSD p-Code or M-code)
- Sophisticated multi-pass compiler allows forward references and code optimization
- Desktop/automates Edit/Compile/Link cycle
- FileSystem, RealInOut, LongInOut, InOut, Strings, Storage, Terminal
- Streams, MathLib0 and all standard modules
- Directory search paths
- Supports real numbers and transcendental functions ie. sin, cos, tan, arctan, exp, ln, log, power, sqrt
- 3d graphics and multi-tasking demos
- CODE statement for assembly code
- 370-page manual
- Installs on Hard disk and RAM disk
- No royalties or copy protection
- Phone and network customer support provided

Pascal and Modula-2 source code are nearly identical. Modula-2 should be thought of as an enhanced superset of Pascal. Professor Niklaus Wirth (the creator of Pascal) designed Modula-2 to replace Pascal.

## Added features of Modula-2 not found in Pascal

- CASE has an ELSE and may contain subranges
- Programs may be broken up into Modules for separate compilation
- Machine level interface
  - Bit-wise operators
  - Direct port and Memory access
  - Absolute addressing
  - Interrupt structure
- Dynamic strings that may be any size
- Multi-tasking is supported
- Procedure variables
- Module version control
- Programmer definable scope of objects
- Open array parameters (VAR r: ARRAY OF REALS;)
- Elegant type transfer functions

Ramdisk Benchmarks (secs)	Compile	Link	Execute	Optimized Size
Sieve of Eratosthenes:	6.2	4.3	3.5	2600 bytes
Float	6.4	4.8	8.3	4844 bytes
Calc	5.5	4.2	3.3	2878 bytes
Null program	5.1	3.2	—	2370 bytes

```

```

## Product History

The TDI Modula-2 compiler has been running on the Pinnacle supermicro (Aug. '84), Amiga (Jan. '86) and will soon appear on the Macintosh and UNIX in the 4th Qtr. '86.

**Regular Version \$79.95 Developer's Version \$149.95 Commercial Version \$299.95**

The regular version contains all the features listed above. The developer's version supplies an extra diskette containing a symbol file decoder - link and load file disassemblers - a source file cross referencer - symbolic debugger - high level Windows library Module - Ramdisk and Print Spooler source files - Resource Compiler. The commercial version contains all of the Atari module source files.

## Other Modula-2 Products

- Kermit - Contains full source plus \$15 connect time to Compuserve. \$29.95
- Examples - Many Modula-2 example programs to show advanced programming techniques \$24.95
- GRID - Sophisticated multi-key file access method with over 30 procedures to access variable length records. \$49.95

# The Tax ADVANTAGE™

FOR PEACE OF MIND AT TAX TIME

Income Tax Preparation for Individuals and Sole Proprietors

The Tax Advantage takes you through Form 1040 and the other most common tax forms quickly and easily. It does all the calculations for you. On Form 1040, the program actually calculates your tax after every entry, instantly updating your screen as you make changes and corrections. It will increase your speed, make the work easier, and reduce the likelihood of error. You can also make lists and supporting statements by itemizing a line and print all the forms and statements out to submit them to the IRS.

- Includes tax law updates that affect your 1986 taxes
- Forms 1040, 2106, 2441, 4562, 6251
- Schedules A, B, C, D, E, G, SE, W
- IRS approved printouts
- Supports over 235 printers by 50 manufacturers
- On Best-seller Lists since 1982

Federal and California State Income Tax versions available for Apple®, Atari®, Commodore®, and IBM® computers and compatibles.

# CLOCK CALENDAR

For ATARI ST

The Navarone **TIMEKEEPER™** module plugs into the cartridge port on the Atari 520/1040 ST computers. A non-copy protected program disk is supplied that contains all the programs needed to install the **TIMEKEEPER™** and operate as either an accessory or from an AUTO folder.

**TIMEKEEPER™** is no doubt the most valuable and crucial add-on component of your Atari ST computer system. Never again will you have to enter the time and date each time you turn on your computer. When you turn off your computer (or even unplug the **TIMEKEEPER™** module), it keeps on ticking, maintaining accurate time so you won't ever have to worry about setting the time and date again. With **TIMEKEEPER™**, you get an automatic record of time and date of every file you create or update, right in the directory.

## FEATURES:

- Extender slot allows use of other cartridge products.
- Alarm software provided.
- Removable battery (no need to un-solder to replace batteries.)
- Clock display window.

The **TIMEKEEPER™** comes complete, ready to use, no assembly required. You don't have to take your computer apart to use it.

**Dr. T's** MUSIC SOFTWARE

## THE MOST POWERFUL MIDI MUSIC SOFTWARE IS NOW AVAILABLE FOR THE MOST POWERFUL HOME COMPUTER!

Dr. T's Music Software is currently developing a complete line of MIDI music software taking FULL advantage of the power and features of the ATARI 520/1040ST computers.

### NOW AVAILABLE . . .

**KEYBOARD CONTROLLED SEQUENCER** \$195  
Full MIDI parameter/note editing, cut and paste editing, 48 tracks, 126 sequences, 50,000+ notes 520ST; 130,000+ notes 1040ST, MIDI song pointer, and MUCH MORE!

**MIDI RECORDING STUDIO** \$39  
6-Tracks, full cut and paste editing, data compatible with Keyboard Controlled Sequencer, and MORE! Full credit on trade-up to KCS.

**CZ PATCH** \$99  
Graphic display of envelopes, full edit/librarian features, point and click, 240 sounds on the disk!

### COMING SOON . . .

A full line of sound editors, music score printing/editing utilities, algorithmic composition tools, and more! Call or write for details.

**LIMITED ONLY BY YOUR IMAGINATION . . .**

Dr. T's MUSIC SOFTWARE, 66 Louise Rd., Chestnut Hill, MA 02167 (617) 244-8954

# You'll get a kick out of Thai Boxing for the Atari ST.

Examine Artworx' expanding list of ST software:

**THAI BOXING** brings oriental kick boxing to the ST with stunning 3-D graphics and fast action. **Only \$19.95**

**BRIDGE 5.0** Improved bidding and play! Many new features and refinements. **Only \$34.95**

**STRIP POKER** is the classic computer program. Play against Suzi and Melissa; the more you win, the more they take off! **Only \$39.95**

**HOLE IN ONE GOLF** Plays like the real thing and includes an easy-to-use Editor for designing your own golf course. **Only \$19.95**

**COMPUBRIDGE** is Artworx' bridge tutorial, utilizing 10 chapters covering all aspects of the game. **Only \$29.95**

**PEGGAMON** is a new and innovative approach to backgammon. Play against the computer or with a friend in the two-player mode. **Only \$17.95**

**MAILLIST** handles medium to large sized lists. It zip code sorts, alphabetizes, selects by keyword, prints labels, and more. **Only \$19.95**

**BAKER STREET DETECTIVE** brings you back to 1893 London with mysteries to solve just like Sherlock Holmes. **Only \$17.95**

# CHOPPERS MARKET

How about a 8 7/8" by 6 1/8" 128 color (11" diagonal, proportionally correct) WYSIWYG screen dump...in less than 10 minutes printing time from your 84M printer??

## COLOR WITHOUT THE COST!

### — YEMACYB — COLOR PRINTING SYSTEM

This product allows you to make color printouts without having to purchase a color printer.

Easily print your pad, pen, painter, or digitizer graphics files in up to 128 simultaneous colors. Mix your own colors for thousands of combinations. YEMACYB has features that allow you to create large colorful graphics with text overlays, or you can modify and print pictures from your existing graphics library. 1,956,000 pixels of print resolution produces a large, crisp, razor sharp, artwork quality, color printout, suitable for framing. (Image slightly smaller on PROMITER.) YEMACYB works with the Atari 8-bit computer. You will also need a disk drive, four colored printer ribbons, a graphics capable printer interface, plus one of the supported printers with tractor feed. The YEMACYB system supports the C.I.TOH PROWRITER, STAR SG-10, and any EPSON MX/80 graphics compatible printers. (1280x1000 will need Translator.) Also available are YEMACYB PRINTING PACKS for the C.I.TOH PROWRITER, SG-10 (GEMINI 10K), and EPSON MX/80 printers. Each printing pack has four ribbons (one each: yellow, red, blue, black) and the YEMACYB software. While ordinary ribbons will work with YEMACYB, the vibrant colors in our ribbon pack will yield the full spectrum of vibrant hues capable of being produced by the YEMACYB system.

To order YEMACYB (software only), send \$21.95 (\$19.95 + \$2.00 S&H).

To order a YEMACYB PRINTING PACK (software and 4 ribbons), send \$39.95 (\$38.95 + \$1.00 S&H) for SG-10 or 10X spools. Send \$47.95 (\$43.95 + \$4.00 S&H) for MX/80 or PROWRITER cartridges.

If ordering ribbons, please be sure to specify the printer type.

Mail your check or money order to:

## DBSENSE

is a text-based relational database program for Atari ST computers. Color is used, but not needed.

Creating DBs is very simple. There's only one data type (ASCII) and column widths aren't specified.

From keyboard: create, manipulate, display DBs.

Write programs in the DBSENSE language tailored to your own personal or business needs.

Programs can take the place of a spreadsheet.

Programs can load needed DBs from a disk, use data from them to perform calculation (16 digits), create new DBs, fill in preprinted forms, create bills or other documents for a list of clients, print address labels for same clients, etc.

DBSENSE has a word processor with which reports can be merged into letters or other documents.

A program can use the word processor and data from any number of DBs to customize a letter to a list of clients.

## CARDIAC ARREST!

for 800/XL/XE or ST

**\$69**

with 48-page manual

The ultimate adventure — because it's real. "Cardiac Arrest!" is an incredible cardiac resuscitation simulator — so stimulating, it's like a medical adventure game for doctors, nurses, or paramedics. Or for someone who wants to play doctor.

You interpret the on-screen EKG and vital signs, type your order (in regular English), and see what happens. You won't believe this simulator runs on a home computer. Over three years in development by an emergency physician.

### Other ACLS Software:

EKG Teaching ..... \$29  
Protocol Learning ..... \$29  
CardioQuiz ..... \$19

## Pinout Master Charts

This month's Tech Tips column brings together pinout diagrams for all connector sockets on 8-bit Atari computers. (ST owners have a full set of pinout diagrams in the manuals provided with their computers, particularly the ST BASIC manual.)

If you've ever built a hardware project or needed to troubleshoot your computer, you know the value of correct pinout diagrams. But it is often hard to find these diagrams for the 8-bit Atari. And even if you do find a diagram, it is not always clear whether the pinout is facing forward or backward.

Here you have all the 8-bit connector diagrams collected in one place. And they are all displayed in the same

point of view—as if you are looking directly into the socket from the outside of the computer.

Which connectors you'll find socketed on your Atari depends on the model. Connector name labels may also vary slightly from model to model.

One of the World's Most Popular Games on the Macintosh  
**Now Available On ATARI ST!**

# HARRIER STRIKE MISSION

Here's this island off the coast somewhere...the enemy's headquarters. Your weapon? The Harrier Jump Jet, one of the world's most sophisticated technological marvels, which combines the ability to take off and land vertically like a helicopter with the speed and punch of the latest in modern jet armament. Your mission, should you decide to accept it, is to pilot your Harrier from the deck of an aircraft carrier, take out enemy aircraft, locate and destroy enemy headquarters and fuel depot, and safely land back on the deck.

Simple, isn't it? Hardly! Facing you will be some of the

world's nastiest enemy fighter planes launching heat seeking missiles. The good news is that you have three Sidewinder missiles, two 30mm Aden cannon

pods and the ability to maneuver like no other jet in history! The bad news? You have only one plane to fight off five enemy aircraft.

Now wipe that sweat off your brow, don your helmet and gloves, strap yourself

into your seat and GOOD LUCK! 'Nuff said, it's CLOBBERIN' time! Harrier Strike Mission—a 3-Dimensional Flight Combat Simulator for your Atari ST. The first in a series of new projective 3-D simulations from MILES COMPUTING, Inc.

# The Market's Moving... to the **Isgur Portfolio System!** <sup>TM</sup>

## THE ISGUR PORTFOLIO SYSTEM IS:

**WINNER OF "THE EDITORS CHOICE AWARD" – PC MAGAZINE**

Software that helps you manage any combination of investment portfolios more efficiently: stocks, bonds, currencies, options, commodities, mutual funds, and MORE. An easy, quick to learn alternative to the massive "professional" systems, but with all of their features and flexibility.

*"Easy to learn, easy to use, ...gives serious investors many of the tools used by professionals. A four-disk rating!" – INFOWORLD*

## HOW IT WORKS:

**IPS Automatically Updates your Portfolios:** using the latest data from your preferred on-line service. The built in integrated telecommunications module is pre-set to receive Dow Jones, CompuServe, The Source and InfoGlobe.

**Timely Alerts with "Memo" Function:** automatically advises you of option expiry dates, critical short term/long term changes, or your own personal deadlines.

*"A very complete investment package... a lot of thought has gone into the extras." – PERSONAL COMPUTING*

**Flexible and Intuitive:** display, sort, compile, manipulate and print-out your investment data exactly as you want it. By portfolio, by security, or using a whole menu of helpful criteria.

**Powerful Analytical Features Include:** • "Raise Money" • "Splits/Dividends" • "Cash and Margins" • "Suppose or What If" Functions and many more. The combined result? More profitable investment decisions, with less work.

*"It's dangerous to look at any software package and say, 'This is the one', but this one comes very close... a rich variety of information formats and reporting options." – COMPUTERIZED INVESTING*

The Isgur Portfolio System. The investment management program designed by Lee Isgur, Senior Vice-President of PaineWebber, New York, and one of the world's leading financial analysts.

*"The developers obviously consulted with a stockbroker who knows his business." – PC MAGAZINE*

**"Unanimous praise...  
extremely powerful,  
yet easy to use!"**

**– FORTUNE MAGAZINE'S  
1987 INVESTORS GUIDE**

**The Isgur Portfolio System is Only \$249<sup>95</sup>\*  
on IBM PC and Compatibles or \$199<sup>95</sup>\*  
on The MACINTOSH and Atari ST.**
